Discharge of Condition 3 for the proposed development at 53 Joy Lane, Whitstable, Kent, CT5 4DB (Unit C)

This letter has been prepared with reference to planning application CA/20/01025 and is aimed at discharging planning condition 3 (herein referred to as Condition 3) for the proposed development at the above address. Condition 3 relates to the safe management of both surface water runoff and foul drainage from the proposed development.

The combined proposal is for the erection of 3 new residential detached dwellings, on previously undeveloped land located on Joy Lane, Whitstable. This specific application is for the construction of Dwelling C.

The full details of the planning condition are quoted below:

Planning Condition 3

"…No development shall take place until details of the means of foul and surface water disposal, including a detailed sustainable surface water drainage scheme for the site, which is compliant with the Non-statutory Technical Standards for Sustainable Drainage (NTSS) and shall demonstrate the surface water runoff generated up to and including the 100yr critical storm (including allowance for climate change) will not exceed the runoff from the undeveloped site following the corresponding rainfall event, and so as not to increase the risk of flooding both on- or off-site, and including details for the long term maintenance of all surface water drainage infrastructure on site, and including the provision of measures to prevent the discharge of surface water onto the highway, have been submitted to and agreed in writing by the Local Planning Authority (LPA). The development shall be carried out in accordance with such details as are agreed and thereafter maintained…"

Proposed Development

The proposed development is for the construction of 3 residential properties, an access road, and a parking area.

This report includes details of how Property C will be drained both in isolation and as part of the wider 3 unit scheme. This is to ensure that suitable provisions for surface water management are in place, in the event units A and B are not completed, or are completed at a later date, e.g., due to the phased nature of the development. Separate reports detailing the isolated drainage solution for properties A and B have also been produced and are to be submitted separately. Figure 1 below shows the proposed roof area for property C.

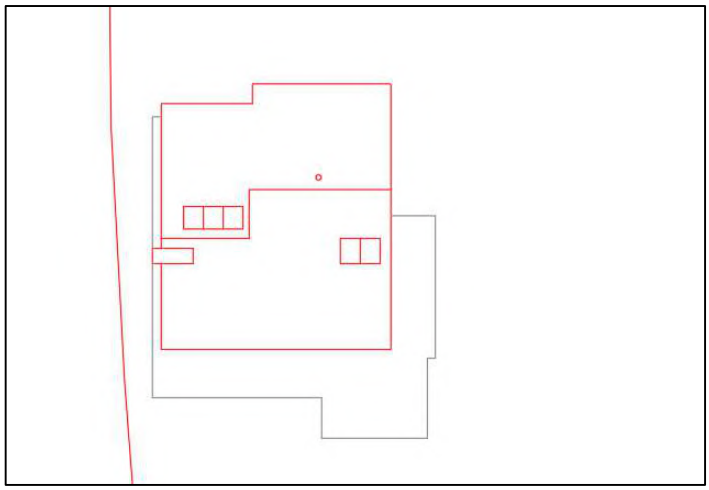

Figure 1 – Proposed plot C.

National Policy for SuDS

In accordance with the 2019 National Planning Policy Framework (NPPF), Sustainable Drainage Systems (SuDS) should be included within the proposed development scheme where it is practicable to do so. The proposed development must also maintain, or ideally reduce, the rate at which runoff is discharged offsite. This is to ensure that the offsite risk of surface water flooding is not increased by the development.

The proposed development will also need to comply with the Non-statutory Technical Standards for Sustainable Drainage Systems (NTSS) and as such, the NTSS has been referenced when devising the drainage system.

Lead Local Flood Authority (LLFA) Comments

Comments were provided by the LLFA on the 20th July 2020, and provide additional information on the level of detail required for Condition 3 to be discharged. This includes:

- Construction drawings or a tender document for the proposed drainage system, including details of the storage tank.
- Confirmation of existing capacity within the surface water sewer network for the area.
- Details of the maintenance strategy, including confirmation that the owners of the 3 properties will be tasked with the ongoing maintenance of the SuDS.

Climate Change

The NPPF (2019) and supporting Planning Practice Guidance Suite (2014) state that residential development should be considered for a minimum of 100 years. The Environment Agency (EA) provides guidance regarding the application of the climate change allowances relating to peak rainfall intensity and how they should be applied to the planning process. The recommended allowances for increases in peak rainfall intensity are applicable nationally and have therefore been considered. For this development, an increase of 40% has been applied to the peak rainfall to account for the impacts of climate change over the lifetime of the development.

Drainage Model and Calculations

A hydraulic model has been constructed for the proposed surface water drainage system using Causeway Flow + and hydrological data obtained from the Flood Estimation Handbook (FEH), via the Centre for Ecology and Hydrology online web portal.

The hydraulic model has been used to test the proposed drainage system for a series of rainfall events, with storm durations ranging from 15 minutes to 7 days, and return periods from 1:2 years, up to and including, the design rainfall event 1:100 years. A 40% increase in peak rainfall intensity has also been applied to the rainfall hyetographs to account for climate change.

Existing Drainage

The existing site has no known surface water drains. However, a survey carried out (by others) has confirmed a connection between the site and foul sewer within the adjacent road.

Asset location data has been obtained from the sewerage undertaker Southern Water (SW), which confirms the location of public sewerage infrastructure near to the site. Figure 2 below delineates the network of sewers for the area around Joy Lane.

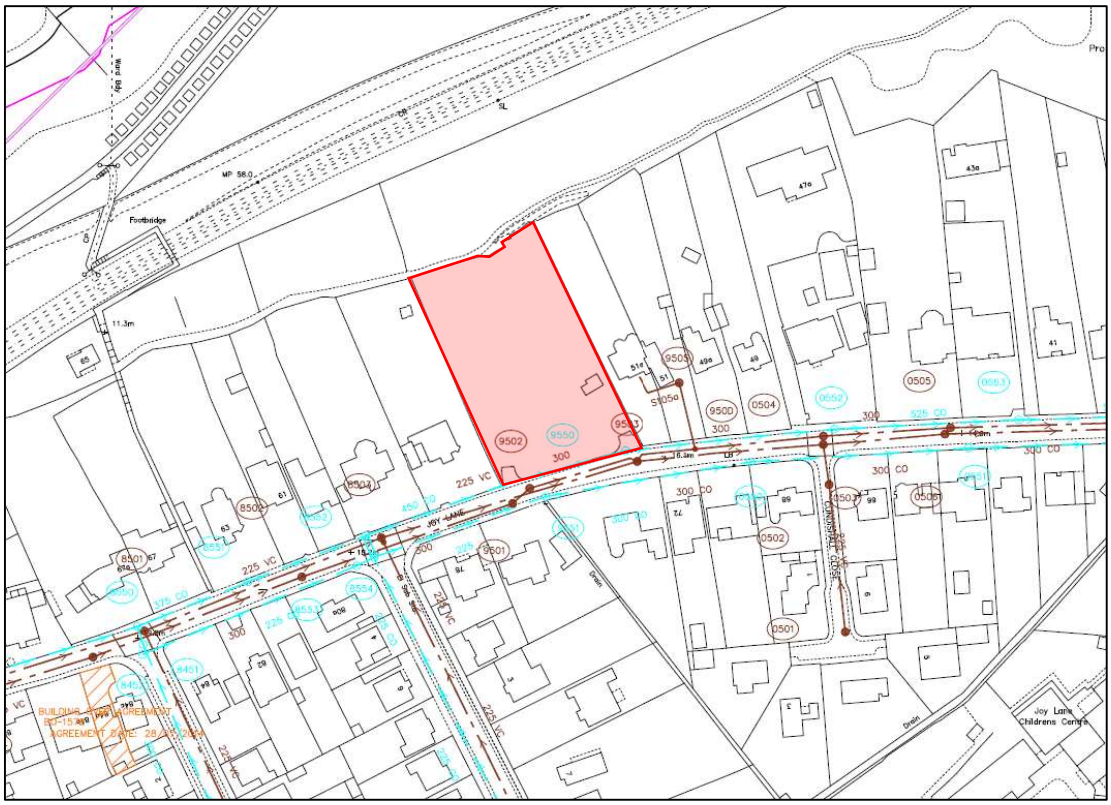

Figure 2 – Sewer mapping for the area around Joy Lane.

Greenfield runoff rates for the site have been calculated using the FEH Statistical Methodology, and are summarised in Table 1 below, along with calculations estimating the pre-development discharge rates based on the total area of existing hardstanding.

Return Period (years)	Greenfield Runoff Rate (l/s/ha)	Pre-development discharge rate based on 380 m² of existing hardstanding (l/s)
1:2	2.3	7.2
1:10	4.2	14.1
1:30	6.2	18.7
1:100	8.2	24.0

Table 1 - Summary of greenfield and existing runoff rates for the site.

With the inclusion of additional impermeable areas onto the site, there will be an increase in the rate at which surface water runoff will be discharged from the site (pre-mitigation). In order to reduce this impact, SuDS will need to be incorporated into the development to ensure that the site complies with the NTSS and local planning policy.

Drainage Hierarchy and Opportunities for Managing Surface Water Runoff

The following opportunities for managing the surface water runoff discharged from the development site are listed in order of preference:

Infiltration – Infiltration testing has been undertaken by the applicant and the results confirm that ground conditions at the site are unsuitable for the use of infiltration SuDS. This option for draining the site has, therefore, been discounted.

Discharge to Watercourses – The nearest mapped watercourse is a small drain located across the public highway to the south of the site. In addition, this drain is located on land outside the applicant's control and does not appear to be connected to the other drainage features (e.g., surface water sewers) in this area. As a consequence, draining surface water runoff from the site into this drain is unlikely to be possible and this option for draining the site has therefore been discounted.

Discharge to Public Sewer System – There are several sewers within the road adjacent to the development site, which could facilitate a new surface water drainage connection to drain runoff from the development. On this basis, a connection to the public sewer system is likely to present the most viable solution for draining the development.

Measures to Prevent Discharge to the Highway

To prevent runoff from the site from draining to the highway, threshold drains will be incorporated into the drainage design for the access road into the development. These drainage channels will direct runoff into the SuDS for the site and will ensure that water does not leave the site during storms with return periods less than the design rainfall event. These drainage channels are shown on the detailed drainage drawing (Figure 2) below.

Drainage for Property C (In Isolation)

Assuming Property C is constructed in isolation from the 2 remaining units, the drainage system can still be constructed beneath the area that will eventually become the access road and parking for the dwellings. The drainage layout plan below shows how a large geo-cellular storage tank can be incorporated into the proposals to drain Property C and future proof the design for further development at a later date, so that units A and B can be constructed without the need for any upgrades to the capacity of the proposed storage tank.

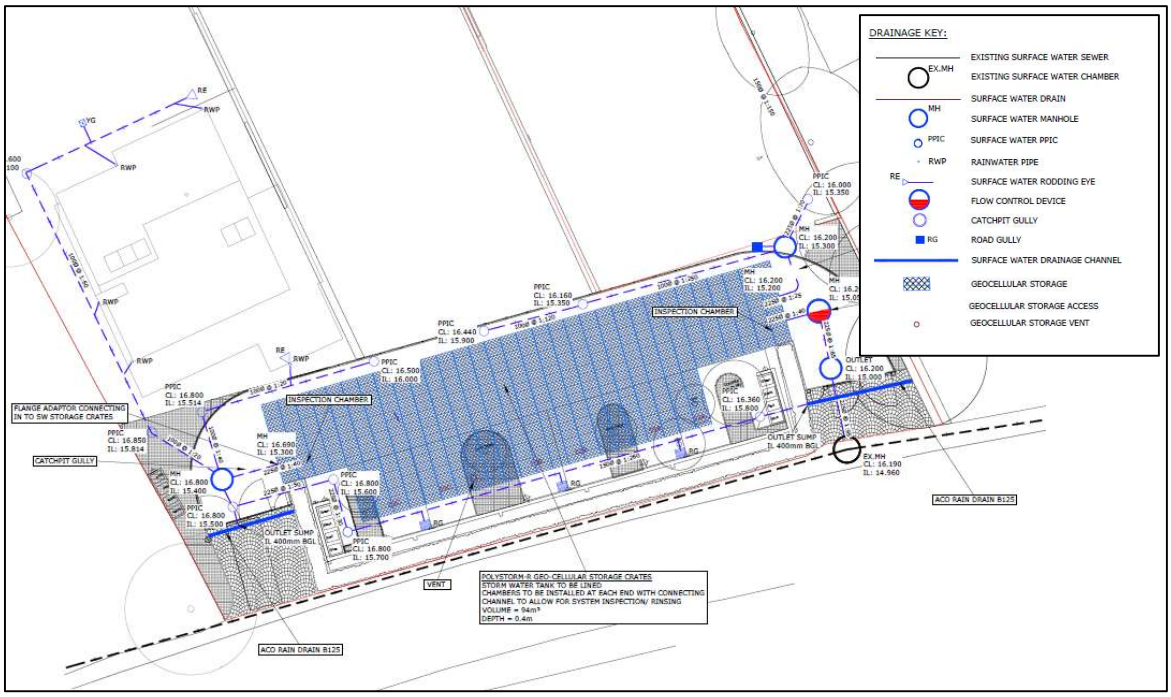

Figure 3 – Surface water drainage layout for Property C, Joy Lane, Whitstable.

Geo-Cellular Storage Tank – Runoff from Property C and the surrounding hardstanding and parking area will be drained to a storage tank located beneath the access drive and parking area. The design parameters for the geo-cellular storage tank are summarised in Table 2 below.

Parameter	**Design (1:100yr+40%cc event)**
Total impermeable area drainage to SuDS	1070 m^2
Urban creep allowance	10 %
Infiltration	Not permitted (high ground water and clay soils)
Porosity of storage tank	95 %
Dimensions of storage tank	~235m^2 x 400mm (deep)
Required storage volume	~ 90 m^3
Flow restriction device	Vortex flow control (2.0l/s)

Table 2 – Proposed drainage storage tank for a design of 1:100+ 40%cc.

Results from Hydraulic Model

The performance of the proposed drainage system has been tested by applying a series of rainfall events with varying return periods to a hydraulic model of the proposed drainage network. These calculations have been undertaken based on the combined 3 unit scheme, to ensure that on completion the storage

provided by the site will be sufficient. A range of storm durations have been applied to each of the return period scenarios to determine the peak runoff rates from the proposed development. The proposed drainage system has been modelled in Causeway Flow + V9.0, using the FEH2013 rainfall methodology.

If Property C is constructed prior to properties A and B, the total area draining to the storage system will be less than that used within the drainage model (discussed above). The consequence of this will be that the storage tank will have spare capacity during the design rainfall event and will therefore be less likely to surcharge. The results from this hydraulic model are summarised in Table 3 below.

Element	**Surface water runoff calculations for a range of return period events for the pre- and post- developed scenarios**		
	1:2yr	**1:30yr**	**1:100yr**
Pre-development discharge	7.2 l/s	18.7 l/s	24.0 l/s
Proposed discharge rate from storage tank, including 40% allowance for climate change	1.9 l/s	1.9 l/s	2.1 l/s

Table 3 – Pre- and post- development surface water runoff calculations.

From Table 3 above and the model results appended, it is evident that with the inclusion of the proposed SuDS, there is potential to accommodate all of the surface water runoff from the site, up to and including the design rainfall event. This provides runoff characteristics which are closer to the greenfield runoff rates for the site and therefore, presents a betterment when compared to the existing situation. Consequently, it is considered that this will be acceptable to the LPA and LLFA.

Combined Site Drainage

A drainage layout plan for the 3 unit scheme has been produced (Figure 4 below), and shows how units A and B can be connected into the drainage network either as a single phase or in isolation.

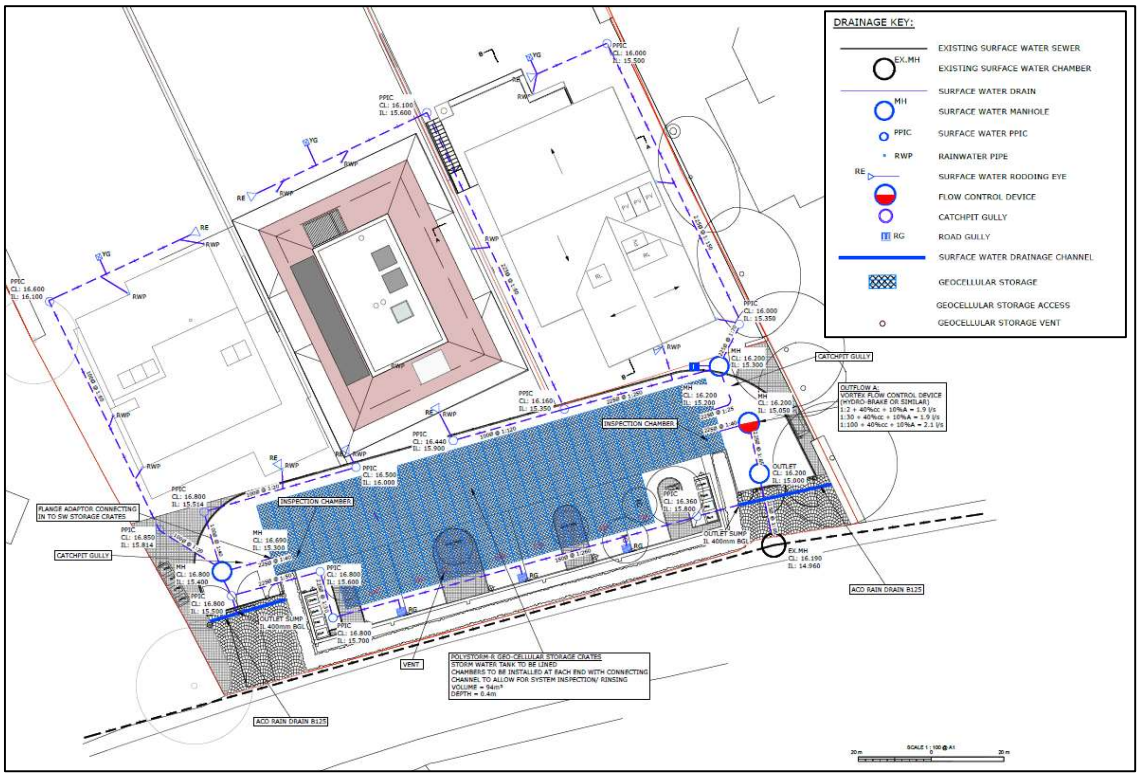

Figure 4 – Combined site drainage for the 3 unit scheme.

Existing Sewer Capacity

The sewerage undertaker has been contacted to determine the capacity of the existing sewerage infrastructure at the site, and to confirm whether the additional runoff from the proposed development can be accommodated within the existing surface water sewer network, without the need to upgrade the sewers in this area. The results of this capacity check have confirmed that there is currently adequate capacity for the proposed 2.1l/s discharge, and a copy has been appended to this letter.

Design Exceedance

The proposed drainage system has been designed to accommodate surface water runoff generated under an extreme rainfall event, with a return period of 1 in 100 years, including a 40% increase in peak rainfall intensity (to account for the impacts of climate change). As such, this additional percentage increase complies with the EA's most contemporary guidance on climate change for the upper allowances.

Nonetheless, in the event of an exceedance scenario (i.e., an event which exceeds the design rainfall event), it is considered likely that water would back up within the drainage system and overflow to the rear of the properties, resulting in localised flooding within the gardens. Figure 5 below shows the proposed drainage system and likely pathways water will take as it flows across the site, in the event that the drainage system fails.

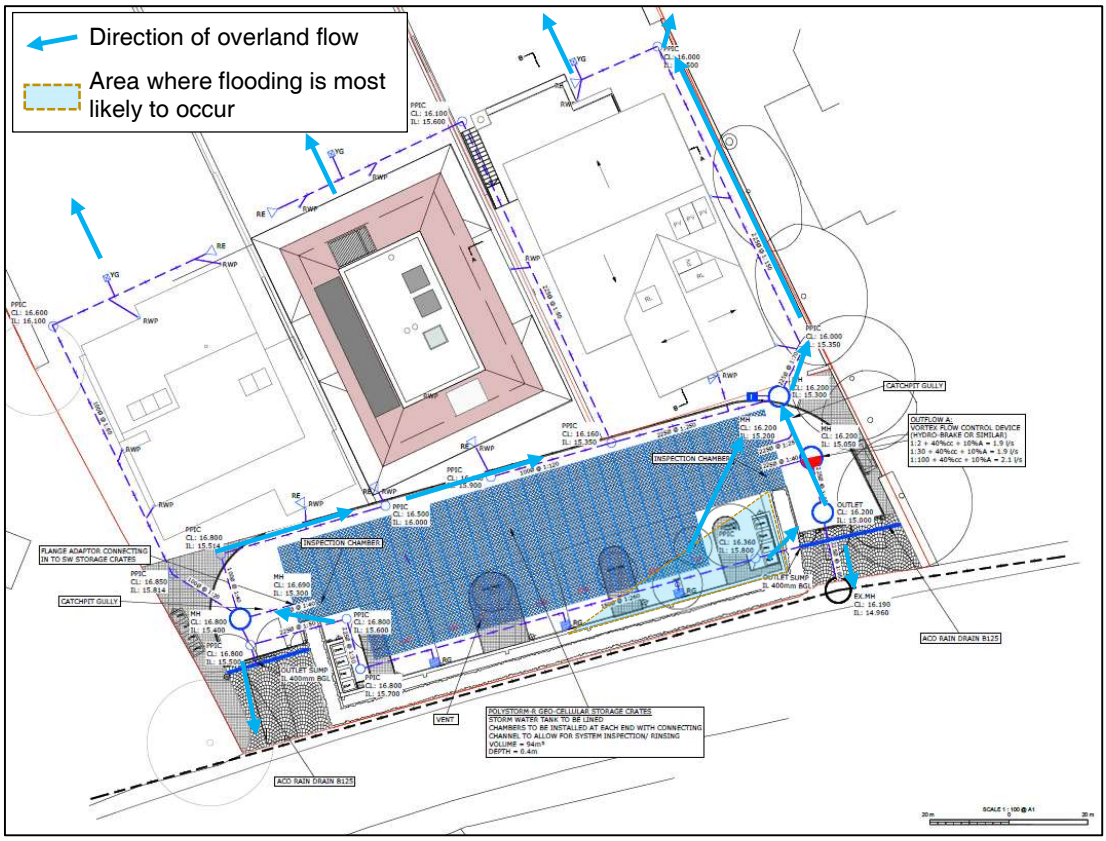

Figure 5 - Anticipated flow routes during an exceedance or blockage event.

In summary, with the inclusion of the SuDS discussed within this strategy, the proposed surface water drainage solution will not increase the risk of flooding at the site or within the surrounding area during an exceedance event and is therefore considered appropriate.

Maintenance and Management

A maintenance and management plan for the drainage system and SuDS has been prepared, and a copy is appended to this document.

It is envisaged that each of the property owners / occupants will be tasked with the ongoing maintenance of the drainage system. As a result, for Property C in isolation, maintenance for the entire drainage system would be tasked to the occupants / property owner. As additional units are constructed, agreements would need to be put in place to ensure responsibility for maintaining the SuDS is spread across all of the land owners / occupiers. As a result, drains lying within private land ownership will remain the responsibility of the individual property owner, with the communal elements of the drainage system being maintained as part of an agreement between all 3 property owners.

Management of Foul Water

In general, there are two methods for draining effluent from proposed developments. The preferred solution is a connection to the public sewer network, which is controlled by the sewerage undertaker. Nonetheless, if there are no sewers located near to the development site or if there are particular reasons why a connection to the public sewer system would not be possible, e.g., topography, cost, environmental concerns etc., then the use of package treatment systems or cesspits will be permitted.

In this case, the nearest public sewers to the site are located beneath the adjacent road (Joy Lane). The SW sewer mapping shows that there are two foul sewers located beneath this road and evidence from onsite investigations, undertaken by others, has confirmed that an existing foul drainage connection from the site to one of these sewers is present. A connection to the existing foul sewer system will therefore be the most viable solution for draining foul wastewater from the proposed development.

The peak rate at which foul wastewater is discharged from property C is 0.05l/s. Given the relatively low flow rate, it is considered unlikely that the additional foul wastewater discharged from the property will have a significant impact on the sewer system, or increase the risk of sewer flooding in this area.

A pre-development enquiry has been undertaken with SW to confirm the capacity of the existing foul sewer network at the site and ensure that it is suitable for up to 3 additional units, with a combined flow rate of ~0.14l/s. The results of this enquiry confirm that there is sufficient capacity within the existing network to accommodate wastewater from the 3 new dwellings. Consequently, capacity for Property C will be available irrespective of whether it is constructed in isolation or as part of the wider 3 unit development.

Summary

The opportunities for draining surface water runoff and foul wastewater from the proposed development of both Plot C and the 3 unit scheme at Joy Lane, Whitstable have been assessed, with the aim of discharging Condition 3.

The analysis has shown that discharging surface water runoff into the existing public sewer system will present the most viable solution for draining the site. A large geo-cellular storage tank has been incorporated into the drainage system for the development, in order to provide storage for stormwater. This tank has been designed to manage runoff from the 3 unit scheme but is still appropriate for use in managing runoff from the single dwelling.

The results of the hydraulic drainage model for the proposed drainage system confirm that the proposed SuDS have sufficient capacity to store runoff from the entire design rainfall event, with a return period of 1:100 years, including a 40% increase in peak rainfall intensity to account for climate change. The peak discharge rate under this scenario is limited to a rate of 2.1l/s. As a consequence, the proposals meet the requirements of both the NTSS and the NPPF.

Construction drawings for the proposed drainage system have been prepared, alongside an indicative drawing showing plot C and the storage tank in isolation. A copy of these drawings is appended to this report.

Maintenance and management schedules for the proposed SuDS are included within a maintenance plan that has been prepared for the development, a copy of which is appended to this document.

The opportunities for disposing foul wastewater from the site have also been considered, and calculations have been undertaken to estimate the increase in foul wastewater discharged offsite. The appraisal demonstrates that the most viable solution is to connect into the existing foul sewer network located in Joy Lane.

Confirmation of the foul and surface water sewer networks capacity has been obtained from the sewerage undertaker and following the discharge of Condition 3, approval for any new sewer connection(s) will need to be obtained from the sewerage undertaker.

The information contained within this document provides details to demonstrate how surface water runoff and foul effluent will be managed on site, and addresses the comments raised by the LLFA. I trust that this information will be sufficient to enable Condition 3 to be discharged in full.

Yours faithfully,

Stephen Hayward BSc (Hons) ARSM MCIWEM
Senior Drainage Analyst

Maintenance and Management Plan for the Drainage at Joy Lane, Whitstable.

Date: 18 September 2020
Your Ref: CA/19/00456
Our Ref: SAH/2632/10909_M
Email: stephen@herringtonconsulting.co.uk

Maintenance Plan for the Sustainable Drainage System at Joy Lane, Whitstable.

Introduction

The proposed drainage network at Joy Lane, Whitstable, comprises a Sustainable Drainage System (SuDS), in addition to the more traditional piped drainage system. The maintenance requirements may therefore differ from a site which is solely drained using a traditional piped drainage system.

What are SuDS?

SuDS are drainage features designed to replicate natural processes of runoff and reduce the risk of flooding, as well as provide benefits to biodiversity and ecology. Integrating water into developments using SuDS can also provide benefits to the amenity of a site, creating nicer places for people to live.

Details of the proposed Drainage System

The drainage layout plan showing the location of the proposed SuDS is appended to this document, and the key drainage features are labelled on Figure 1 (below).

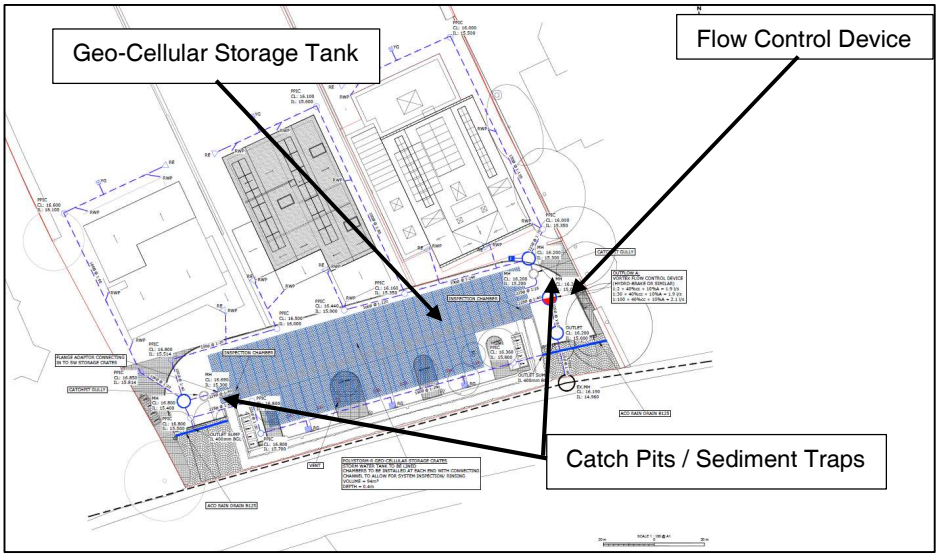

Figure 1 – Plan showing the proposed SuDS that will need to be maintained.

Company registered in England and Wales

The drainage system at Joy Lane consists of a piped drainage network, geocellular storage tank, flow control device, sediment traps, gullies, and linear drainage channels. Each of these elements of the drainage system will require different maintenance.

Maintenance Responsibilities

For any private drainage within the curtilage of each property the responsibility for the continued maintenance will belong solely to the owner of the property.

For the communal elements of the drainage system, including any lateral drains, the responsibility for maintenance will be tasked to all three property owners. This includes the inspection and maintenance of the geo-cellular storage tank. An agreement will need to be drawn up between the property owners to ensure continued maintenance is carried out. The final copy of this maintenance plan should be provided to each of the owners / occupants of the properties to ensure they are aware of their responsibilities with regard to the maintenance of any SuDS.

Maintenance and Management Requirements

Regular maintenance for the drainage system must be carried out to ensure continued performance of the drainage system: Maintenance schedules for the SuDS and drainage components are appended to this document. These schedules include typical inspection frequencies which should be adjusted after the first few years following installation, to account for more or less frequent maintenance and inspection depending on how the drainage system performs after this bedding in period.

List of maintenance schedules included:

- Geo-Cellular Storage
- Flow Control Device
- Pipework
- Sediment Traps / Catchpits
- Road Gullies
- Linear Drainage Channels
- Manholes
- PPIC's

Following construction, manufacturer-specific maintenance requirements must also be appended to this document.

Contact Details

Contact details for all manufactures should be included within the final maintenance and management plan for the site, which will need to be provided to the site occupants. At present, the following contact information is known:

Designers: Herrington Consulting Limited

- *Email: enquiries@herringtonconsulting.co.uk*
- *Telephone: 01227 833855*
- *Website: www.herringtonconsulting.co.uk*

Lead Local Flood Authority: Kent County Council

- *Email: SuDS@kent.gov.uk*

To be contacted if changes to the drainage system are proposed following construction.

Sewerage undertaker: Southern Water

Website Advice: www.southernwater.co.uk/help-advice/what-to-do-in-an-emergency

To be contacted if flooding from the sewer network offsite occurs, or if changes to the drainage system are to be made.

Flow Control Device: Manufacturer TBC

Geo-Cellular Storage Crates: Manufacturer TBC

Emergency Action

Spillages: The outfall from the drainage system discharges into a Southern Water public sewer. Any accidental spillage of pollutants, such as; oils, spirits, etc. could result in contamination reaching the sewer network. If a spillage or accident occurs it is recommended that the outlets from the site are closed as soon as possible to reduce the potential for contamination to be discharged offsite. The Environment Agency should be informed of the spillage as soon as possible via their incident reporting service and should be contacted during the clean-up and remediation operations. Further advice can be obtained from https://www.gov.uk/report-an-environmental-incident

Flooding: If residents or maintenance personnel notice evidence of the drainage system failing e.g. from visible flooding or deformation of the land surface around pipes, manholes, or geo-cellular storage crates, the contractor responsible for installing the drainage system should be contacted as soon as possible to provide advice. It may also be necessary to contact the manufacturer of the geo-cellular storage tank and flow control device, and the designers of the drainage system. Inspections should also be carried out to determine the source of the failure.

Summary

The traditional elements of the drainage system, as well as the SuDS will require maintenance. The owners of the properties will be tasked with the maintenance of the proposed drainage system and SuDS.

This maintenance agreement should include a detailed maintenance and management plan which expands on the above maintenance strategy, which should include all of the manufacturer specific maintenance requirements.

Attached

Operation and Maintenance Schedule – Geo-Cellular Storage System		
Maintenance Schedule	**Required Action**	**Typical Frequency**
Regular maintenance	Inspect and identify any areas that are not operating correctly. If required, take remedial action.	Monthly for 3 months then annually
	Remove debris and sediment from the catchment surface, wherever is presents a risk to the performance of the drainage system,	Monthly, or as required based on inspection frequencies.
	Remove sediment from pre-treatment structurers (e.g. sediment traps) and from internal forebays	Annually or as required based on inspection frequencies
Remedial Actions	Repair; inlets, outlets, overflow pipes, and vent mechanisms	As required, based on inspections
	Replace tank or geotextile if significant damage is observed or geotextile is torn.	As required
Monitoring	Inspect and check all inlets, outlets, vents, and overflows to ensure that they are in good condition and operating as designed.	Following installation, and annually hereafter
	Survey inside of tank, and at any sediment trap mechanisms, for sediment build-up and remove sediment if necessary. Use inspections to develop a regular maintenance and inspection procedure for sediment removal.	Every 5 years, or as required if inspections show high siltation rates.

ACO RainDrain® B 125

- ✔ Ideal for driveways and light duty applications
- ✔ Easy and quick to install
- ✔ Clip locking grating for secure installation
- ✔ Full range of accessories for professional installation
- ✔ CE marked and fully certified to Load Class B 125 BS EN 1433:2002

ACO RainDrain® B 125

The ideal drainage channel for light duty applications

Manufactured from Vienite®, ACO's high strength recycled polymer concrete material, ACO RainDrain® B 125 is suitable for vehicle traffic up to Load Class B 125.

The high quality ACO RainDrain® B 125 channels interlock, allowing for quick and easy installation.

The channel comes complete with a cast iron Heelguard™ ATec grating making it ideal for driveway applications.

A full range of accessories are available, designed to aid simple and fast installation.

Applications

- Driveways
- Small private car parks
- Garage thresholds

ACO RAINDRAIN® B 125 INSTALLATION

Dig trench 318mm wide (218mm wide if against a structure) by 200mm deep for channel (400mm deep for sump). Mark finishing height with fixed line 3mm below final surface. Lay 100mm (min.) bed of concrete.

Knock out pre-formed outlet from the inside (marked with hammer symbol) or fit sump or outlet endcap. Position sump or outlet channel on concrete bed, fit PVC-U union/trap to drainage pipework.

Lay channels starting from outlet/sump, ensuring joints connect by lowering units horizontally. Fit endcap to end channel. For fully watertight joints, use a suitable sealant (contact ACO for further advice).

With gratings fitted, haunch around channels/sumps with concrete (suitable fill material). Final surface to be 3mm above grating. Bricks/paviours should be laid in mortar for lateral stability.

Polystorm Access

Data Sheet

PRODUCT INFORMATION **P1** **ISSUE 3 - JAN 2016**

Polystorm Access provides a 1m x 0.5m shaft within a Polystorm geocellular structure to enable surface access for remote camera inspection and maintenance activities, such as flushing and rodding.

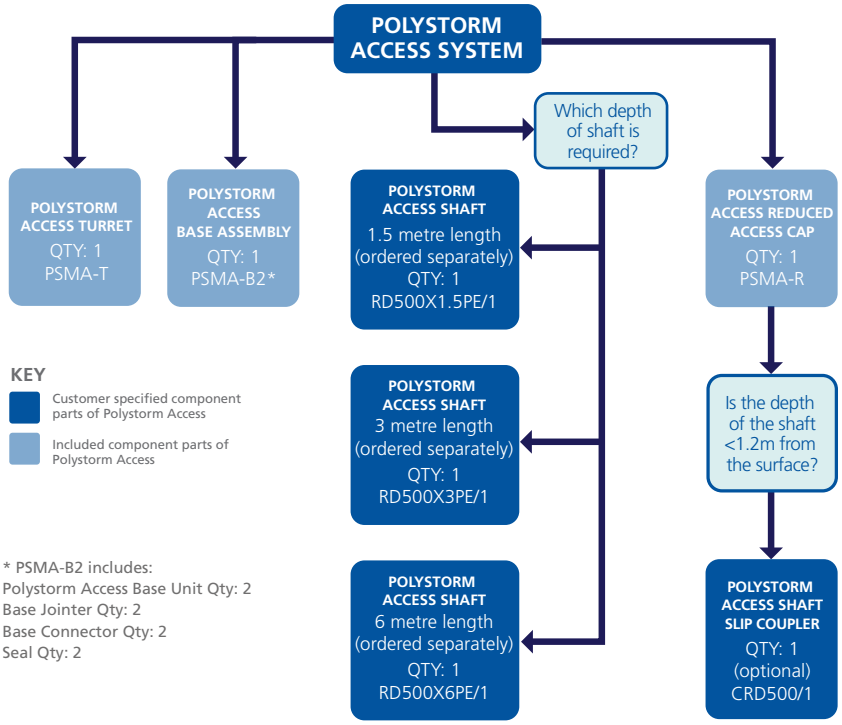
The system consists of a 500mm diameter shaft which extends from surface level to the top of a Polystorm structure, at which point a turret provides an interface between the shaft and the inspection chamber within the Polystorm structure. At the bottom of the chamber, a base unit interlocks with the surrounding layer of Polystorm cells whilst supporting the geomembrane. A 350mm reduced access shaft cap is provided to comply with inspection chamber regulations.

Polystorm Access is suitable for use with Polystorm, Polystorm-R, Polystorm Lite and Polystorm Xtra and may be combined with Polystorm Inspect for full length remote inspection and maintenance.

Please note: The Polystorm Access turret and base assembly are black. They are shown blue for illustration purposes.

Key Benefits

- Meets minimum 450mm width requirement for inspection chamber access, with 350mm reduced access where regulations dictate
- Integrated solution; can be used with Polystorm Inspect to monitor internal volume of geocellular structure
- Base unit provides smooth transition between Polystorm Inspect units
- Multiple inspection configurations can be achieved when used in conjunction with Polystorm Inspect
- Manufactured from polyethylene for light weight, ease of handling and high strength
- Sustainability: All components 100% recyclable after use



* PSMA-B2 includes:
Polystorm Access Base Unit Qty: 2
Base Jointer Qty: 2
Base Connector Qty: 2
Seal Qty: 2

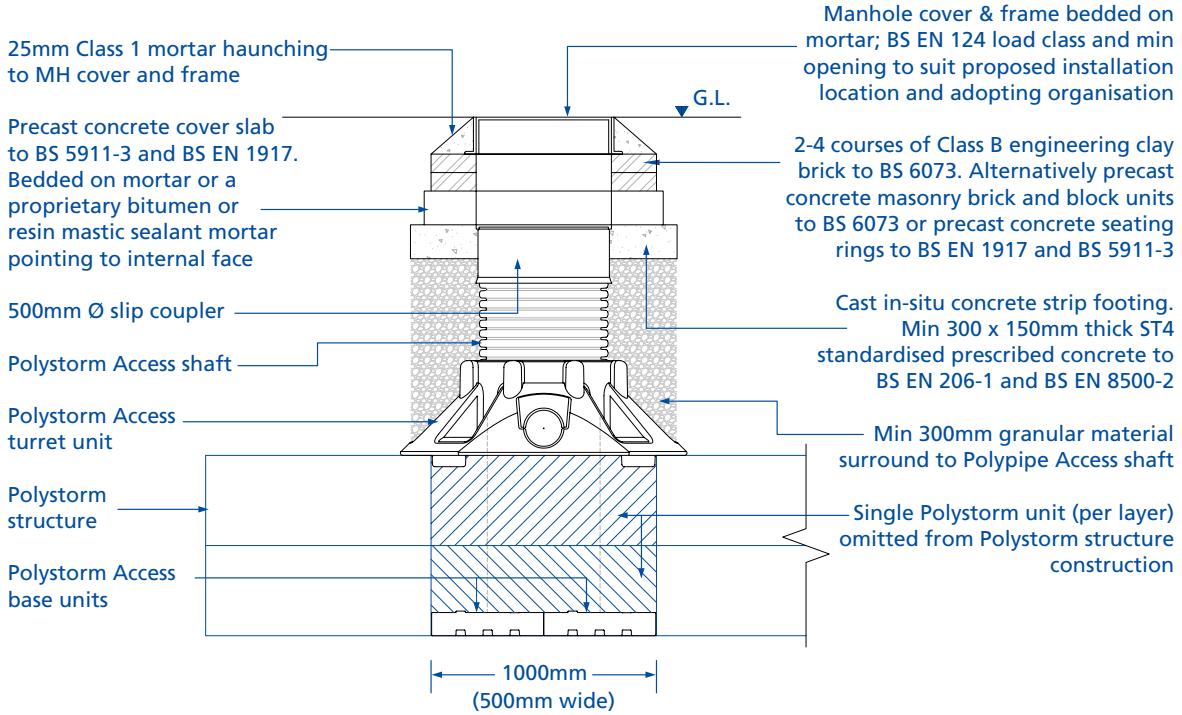
Polypipe

Polystorm Access

Data Sheet

PRODUCT INFORMATION **P2** **ISSUE 3 - JAN 2016**

Typical Elevation



Please note: Above is a typical installation detail for a Polystorm tank with groundwater below the base of the unit. For installation with groundwater above the structure invert please contact our Technical Team on **+44 (0) 1509 615100** or email **civils@polypipe.com**

Polypipe Plastics Expertise

Polystorm Access is manufactured from sustainable polyethylene using the proven rotational moulding technique.

Reliability and Performance

All components in the Polystorm Access system have a design life of up to 50 years where ground conditions allow.

Easy Handling and Installation

Components are light and easy to handle, reducing health and safety risks and speeding up installation. The Polystorm Access shaft can be quickly and accurately cut to the right depth from 500mm Ridgidrain pipe, adding to the ease and flexibility on-site.

Nominal Weights

PSMA-B2 = 8kg PSMA-T = 19kg PSMA-R = 4kg

Flexible Positioning

The Polystorm Access turret can be positioned anywhere on a Polystorm structure, providing there are two or more Polystorm cells between the access turret and the structure edge.

The Polystorm Access shaft is variable in length depending on the depth you require.

Features

- 1m x 0.5m inspection chamber within Polystorm structure
- 500mm riser shaft from surface to top of Polystorm structure
- Riser shaft may be extended as required using 500mm Ridgidrain pipe and seals
- It is recommended that the 500mm Ridgidrain pipe access shaft is within the limits of 250-1050mm for a standard installation
- Reduced Access shaft cap (350mm) available where required by regulations
- Utilises existing Polystorm Clips and Shear Connections
- Base unit manufactured from recyclable polyethylene
- Choice of standard shaft lengths

Technical Support

Detailed guidance and assistance is available.

Polypipe

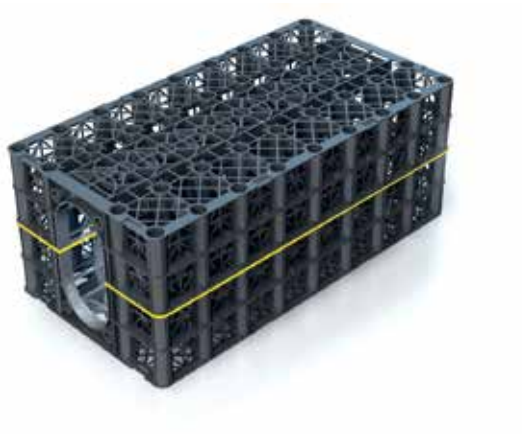
Polystorm Inspect

Data Sheet

PRODUCT INFORMATION **P1** **ISSUE 2 - JAN 2016**

Product code: PSM4

The Polystorm Inspect cell is complementary to the Polystorm range of modular cell solutions. Its primary purpose is to provide a tunnel along the length of a fully installed Polystorm structure to enable access for inspection and maintenance. Polystorm Inspect is a high strength thermoplastic cell which evenly distributes its load through the Polystorm structure.
The tunnel end is left open by default but the unit can be closed off if required by clipping into place the moulded end plate. For purposes of identification the cell features a yellow centre section and end plate.



Key Benefits

- Creates a horizontal tunnel running through the middle of the tank to provide access for inspection and maintenance, i.e. jetting and rodding
- Can be used with Polystorm Lite, Polystorm-R and Polystorm (cannot be used in the same layer as Polystorm Xtra as the Polystorm Inspect cell is deeper)
- Tunnel can be used as a flow inlet track achieving greater stormwater flow distribution within the unit
- Large access tunnel (height 320mm and width 172mm nominal) – allows maximum field of vision while maintaining the system's structural performance
- High strength to weight ratio
- Light weight cell allows easier handling and reduced Health and Safety risk
- Utilises the same Shear Connectors and Clips as the Polystorm range
- The tunnel restricts the dissipation of silt in to the overall structure making inspection and maintenance easier
- Polystorm Inspect cells with 225mm (PSM4CRD225) or 300mm (PSM4CRD300) inlets are available

Applications

Polystorm Inspect is designed to work with the rest of the Polystorm range within a layered hybrid system enabling an intelligently engineered attenuation or infiltration structure to be created. It is intended to be used from the inlet point of the Polystorm structure. If used other than along an inlet tract, the Polystorm Inspect end plate should be used to cap off the tunnel entrance. The most cost effective way to create a tank is to use a combination of Polystorm Inspect cells and other Polystorm modular cells.

UNIT TYPE	VALUE
PHYSICAL PROPERTIES	
Length	1m
Width	0.5m
Depth	0.4m
Total volume	0.2m³
Unit weight	11.6kg*
Cube storage volume	0.188m³ (188 litres)
Volumetric void ratio	94%
SHORT TERM COMPRESSIVE STRENGTH	
Vertical	Minimum 440kN/m²
Lateral	Minimum 63kN/m²
SHORT TERM DEFLECTION	
Short-term vertical deflection	Minimum 70.1kN/m²
LONG TERM DEFLECTION	
Estimated long term vertical deflection (creep)	0.6113Ln (design life in hrs)

Note: The table above is applicable to PSM4 without the end plate.
*Approximate weight
End plates to be purchased separately as required.

Please note: The use of Polystorm Inspect does not negate the requirement for a Silt Trap to be installed prior to the Polystorm structure. The use of a Silt Trap or other silt prevention device would always be recommended.

Polypipe

Polystorm-R Modular Cell

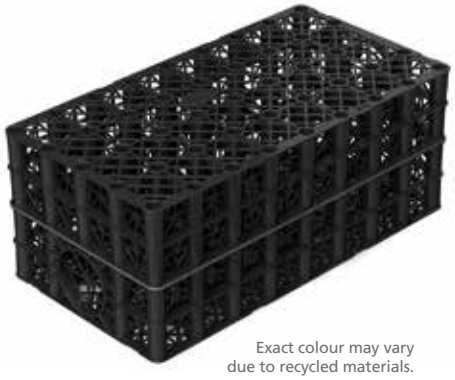
Data Sheet

PRODUCT INFORMATION **P1** **ISSUE 4 - SEPT 2017**

Product code: PSM1A

The Polystorm-R modular cell is ideally suited for loaded applications at greater depths, such as housing, commercial and infrastructure projects and has a compressive strength of up to 61 tonnes/m². It offers all the proven performance of the Polystorm cell, with the added benefits of being manufactured from over 90% recycled material content.

Wherever performance criteria and standards allow, we will always maximise the sustainability of our products by using post consumer plastics in their manufacture. By sourcing and carefully controlling the quality of the recycled material we use our precision injection moulding. Therefore we are able to guarantee consistent quality in our recycled plastic, giving you the confidence and the performance levels you expect from the market leader.



Exact colour may vary due to recycled materials.

Key Benefits

- Made from specially selected and controlled recycled materials
- Environmentally friendly, sustainable solution
- Has undergone stringent testing to ensure product performance
- Compressive strength of 61 tonnes/m²
- Ideal for retention, attenuation and infiltration applications with a suitable geomembrane or geotextile
- BBA approved
- Allow flexibility of shape - ideal for shallow excavation systems, narrow strips or use in restricted areas
- Can be used as part of a value engineered hybrid system with Polystorm, Polystorm Lite and Polystorm Xtra
- Integrated inlet and outlet
- 3D flow throughout the structure
- 95% void ratio
- Light weight yet robust - excellent Health and Safety and installation benefits
- 60 years creep limited life expectancy

Technical Support

Detailed guidance and assistance is available.

Polypipe

Polystorm-R Modular Cell

Data Sheet

RECOMMENDED MAXIMUM DEPTH OF INSTALLATION (to cell invert) [m]

TYPICAL SOIL TYPE	TYPICAL ANGLE OF SHEAR RESISTANCE	SOIL WEIGHT kN/m³	WITHOUT GROUNDWATER (below base of cells) NORMAL CASE		WITH GROUNDWATER AT 1M BELOW GROUND LEVEL AND UNITS WRAPPED IN GEOMEMBRANE	
			Pedestrian	Trafficked (cars) <3000kg GVW	Pedestrian	Trafficked (cars) <3000kg GVW
Stiff over consolidated clay e.g. London clay	24	20.0	2.2	1.9	1.8	1.6
Normally consolidated silty sandy clay e.g. alluvium, made ground	26	19.0	2.4	2.2	1.9	1.7
Loose sand and gravel	30	18.0	3.0	2.7	2.0	1.9
Medium dense sand and gravel	33	19.0	3.2	2.9	2.0	1.9
Dense sand and gravel	38	20.0	3.7	3.5	2.1	2.0

Note:
1) Stated depths based on the calculation methodology detailed within CIRIA C680 (2008)
2) Assuming water density = 10.0kN/m³
3) Assumed ultimate limit state (ULS) partial factor of safety applied to: Material = 2.75 Lateral pressure = 1.35

Durability

The polymer material used in the manufacture of the Polystorm-R unit has an adequate resistance to attack from the type and quantities of chemicals that may be expected to naturally occur in uncontaminated soils and rainwater runoff. When installed in accordance with our recommendations, it is expected that the Polystorm-R unit will have a design life in excess of 60 years*. The installer of a proposed geocellular structure should ensure that an appropriate design check has been undertaken, in accordance with the recommended methodology and factors of safety given in CIRIA C680 (2008), Structural Design of Modular Geocellular Drainage Tanks, prior to the commencement of construction activities.

* Derived from long term extrapolated creep testing

Notes

1. Unless stated, all values are nominal and may vary within normal production tolerances.
2. The characteristic unit parameters stated have been based on Polypipe BBA certificate N° 06/4297, sheet 3.
3. Polypipe reserve the right to change product specifications without prior notice.
4. This document is uncontrolled and updates will not be issued automatically.

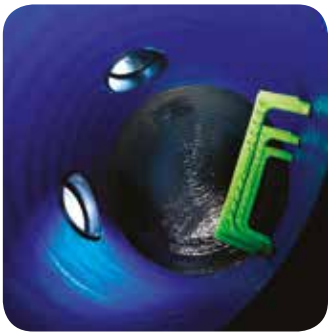
Polypipe

RIDGISTORMSeparate Catchpits

Data Sheet

PRODUCT INFORMATION **P1** **ISSUE 1 - MAY 2016**

RIDGISTORMSeparate Catchpits are designed to separate silt and other particles from stormwater, helping to protect the downstream drainage system and local environment. They can be integrated into our range of pipe systems, such as Ridgidrain and Ridgistorm-XL to offer a fully integrated drainage system.



Applications

RIDGISTORMSeparate Catchpits are pre-fabricated for use in a range of stormwater systems requiring silt and debris seperation and retention.

Key Features and Benefits

- Provides easy access for silt collection
- Network Rail Parts and Drawing System (PADs) approved for use in CESS Areas
- Separates silt and debris from the downstream drainage system
- Eliminates wastage associated with in-situ construction
- Multiple inlet and outlet options, supplied with integral sockets as standard allowing quick and seamless connection to pipeline
- Depths can be tailored to suit project requirements
- Optional step rungs to BS EN 13101 and ladders to BS EN 14396
- Integral lifting points available on request to improve Health and Safety of handling and installation
- Stub connections and rocker pipes are available

Other fabrications in our RIDGISTORMSeparate range:

- Silt Traps
- Filter Chambers

Performance

RIDGISTORMSeparate Catchpits are fabricated from Ridgistorm-XL pipework, which is manufactured to meet the material requirements of BS EN 13476:2007 (Part 1-3).

RIDGISTORMSEPARATE CATCHPITS	
PHYSICAL PROPERTIES	
Diameter	450-3000mm
Depth	To suit requirements
Sump depth	To suit (min. 50mm)
Material	HDPE
Colour	Black with blue Interior
Chemical resistance	HDPE is naturally resistant to most chemicals associated with stormwater drainage systems
Inlets/outlets	100-3000mm

Our Ridgistorm-XL Fabrications range

All of our Ridgistorm-XL fabrications are tailor-made, fully-welded, watertight structured wall chambers to suit project-specific requirements. Health and Safety benefits become apparent during handling and installation, due to our fabrications' strong but light in weight nature. In addition, off-site construction ensures uncompromised, high quality products being delivered to site ready-to-install, reducing installation time and costs.

Dear Sir/Madam,

Level 1 Capacity Check Enquiry: 53 Joy Lane, Whitstable, Kent, CT5 4DB.

We have completed the capacity check for the above development site and the results are as follows:

Foul Water

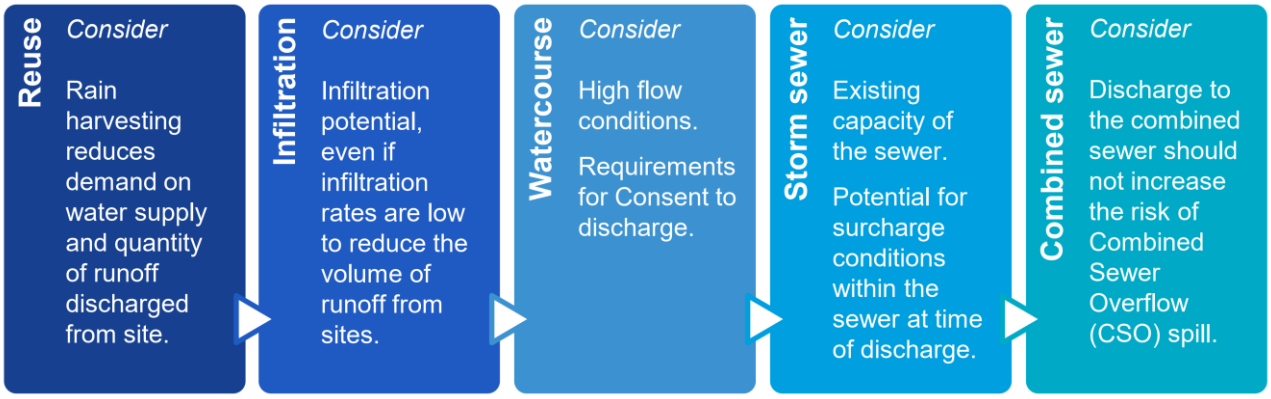
There is currently adequate capacity in the local sewerage network to accommodate a foul flow of **0.03 l/s** for the above development at manhole reference TR0965**9502**. Please note that no surface water flows (existing or proposed) can be accommodated within the existing foul sewerage system unless agreed by the Lead Local Flood Authority in consultation with Southern Water, after the hierarchy Part H3 of Building Regulations has been complied with.

Surface Water

There is currently adequate capacity in the local surface water network to accommodate a surface water flow of **2.1 l/s** for the above development at manhole reference TR0965**9550**.

Although capacity in the surface water network has been identified, in all situations where surface water is being considered for discharge to our network, we require the below hierarchy for surface water to be followed which is reflected in part H3 of the Building Regulations. Whilst reuse does not strictly form part of this hierarchy, Southern Water would encourage the consideration of reuse for new developments.

Southern Water Services Ltd, Registered Office: Southern House, Yeoman Road, Worthing West Sussex BN13 3NX Registered in England No. 2366670



Guidance on Building Regulations is here: gov.uk/government/publications/drainage-and-waste-disposal-approved-document-h

We would welcome the opportunity to engage with you on the design for disposal of surface water, with a particular focus on the potential for incorporating Sustainable Drainage Systems (SuDS), for this development at the earliest opportunity and we recommend that civil engineers and landscape architects work together and with Southern Water.

Where a surface water connection to the foul or combined sewer is being considered, this should be agreed by the Lead Local Flood Authority, in consultation with Southern Water.

It should be noted that although the above assessment indicates that there is capacity available for your proposed surface water flows the LLFA (Local Lead Flood Authority) may impose/request that a lower flow is discharged to the public surface water sewer.

If the excess surface water flows are to be attenuated on site, it could have a significant effect on any proposed Sewer Adoption (S104) Agreements. Any attenuation proposals should be agreed before any works are implemented on site. Where capacity is limited/restricted, agreement should be sought if you are to include any highway drainage within your proposals as Southern Water is not obligated to accept highway flows.

Connecting to our network

It should be noted that this information is only a hydraulic assessment of the existing sewerage network and does not grant approval for a connection to the public sewerage system. A formal Sewer Connection (S106) application is required to be completed and approved by Southern Water Services. To make an application visit: developerservices.southernwater.co.uk/

Please note the information provided above does not grant approval for any designs/drawings submitted for the capacity analysis. The results quoted above are only valid for 12 months from the date of issue of this letter.

Southern Water Services Ltd, Registered Office: Southern House, Yeoman Road, Worthing West Sussex BN13 3NX Registered in England No. 2366670

Should it be necessary to contact us please quote our above reference number relating to this application by email at southernwaterplanning@southernwater.co.uk

Yours sincerely,

Joff Edevane
