Document Review Sheet

This document has been prepared for the sole use of Kent County Council. Its content should not be relied upon by others without the written authority of Cannon Consulting Engineers. If any unauthorised third party makes use of this report they do so at their own risk and Cannon Consulting Engineers owe them no duty of care or skill.

Reference	Date	Author	Checked
CCE/S102/PL/TN/002	10.06.21	RW	JM

This technical note provides the formal response to comments received from Kent County Council on the 15.04.21 (**Appendix A**) by their Sustainable Drainage Team. It should be noted that informal responses were provided by Cannon Consulting Engineers on 13.05.21, and these are re-included below for complete clarity.

Comment A - The submission includes plan drawings, modelled drainage results and a drainage schematic. The node and link/pipe numbering are not fully consistent which leads to some difficulty in cross-referencing connectivity and network representation to confirm that the plan drawings represent the network model in the report. It would be recommended that the schematic be annotated with the plan drawing pipe numbers for easier cross-referencing. A portion of the schematic is also not visible (page 50).

The site layouts with pipe numbers have been provided within the following drawings within report CCE-S102-PL-RP-01-P06:

S102-PL-DR-200-P03 Surface Water Layout Sheet 1 of 3
S102-PL-DR-201-P03 Surface Water Layout Sheet 2 of 3
S102-PL-DR-202-P03 Surface Water Layout Sheet 3 of 3

Comment B - From initial assessment it appears that the operation of the system as shown within the modelled results is appropriate, though the drainage is modified from the originally submitted scheme but is consistent with the overall approach. However, as results are shown for the critical storm duration for each node, without the full network model it is difficult to understand the overall network operation. It would be beneficial if the network simulation solely for the 15-minute summer storm could be provided for the 1 in 30 year and 1 in 100 year plus 20% climate change events.

The 15min summer simulation results are provided within **Appendix B** of this technical note.

Comment C - The drainage system has been designed to criteria agreed with KCC Flood and Water Management team. The current modelled results show that a staged 2 discharge from the site controls surface water for the 1 in 2 year rainfall event to 11.5 l/s, for the 1 in 30 year to 30.1 l/s and for the 1 in 100 year plus 20% climate change to 45/1 l/s. These rates are within the 4 l/s/ha rate as required by Canterbury City Council but it also provides greater control for the more frequent rainfall events and manages potential impacts on Swalecliffe Brook.

Noted.

Comment D - We would enquire as to the purpose for pipe 49.003 as it parallels the system in the highway (pipe no. 10.014, 10.015, 10.016, Surface Water Layout Sheet 2) and would appear to have relative invert levels which would enable discharge to 10.014. There is a lack of clarity as to the connectivity of Link 30.001 (Pipe 49.003) which connects to Node 202 and basin node 89. Node 202

has both an online and offline orifice control. We would recommend that detail of this connection is provided.

Pipe label 49.003 has been updated correctly on plan to 30.001.

The area around nodes 200 and 203 are located in the low spot of the site. Attenuation provided at nodes 200 and 203 was insufficient to contain all flood water and as such, it was necessary to convey water from this area to a larger attenuation facility. In this case, additional attenuation was provided in the main basin (Node 89). The use of the pipe linking node 201 to 202 (pipe 30.001 formerly 49.003) was therefore required to convey water to the basin. Connection of an outfall to the closer manholes 33 or 34 was not possible as it connected the wider network to the low spot and therefore created significant flooding.

In an attempt to remove the need for pipe 30.001, we have maximised the size of the main basin (node 89) to provide additional storage. To remove the extended length of pipe 49.003 we have also connected nodes 200 and 203 etc. to node 34. This was only possible at invert to invert. We have also modified orifice controls and provided an additional 100mm height to the basin top level.

It should be noted that the use of offline orifices is a particular function of the software which allows flows to ignore storage provided by the downstream pipes.

Comment E - The public have raised concerns in relation to the flood levels in the Swalecliffe Brook and the proposed developments impact on these levels and vice versa. The network model utilises a surcharged outfall water level of 9.14m which is very conservative, over the life time of the development. The modelled results demonstrate that the drainage system will retain the development generated surface water with limited overflow for the 1 in 100 year plus 40% climate change event. Given that the surcharge is maintained for the full modelled event, the likelihood of the overflow occurring is lower than presented.

Noted.

Comment F - The designer has utilised orifice controls throughout the drainage system to retain water within the system and make use of its full volume. There are a number of orifices which are extremely small, less than 5 cm in diameter, which are usually located below geocellular systems but in some instances may be downstream of open attenuation (e.g. Node 16). It is usual that we would recommend a larger minimum diameter; however, in this instance if the orifices are below structures which will control debris and other material from blocking the orifice then the risk may be mitigated. We would recommend that the applicant reviews the locations of orifices less than or equal to 5 cm to ensure that blockage will not present a problem.

We have upsized all orifices serving open attenuation features to a minimum of 75mm. On running the amended model we have the following results at the main basin (Node 89):

- 1 in 100 year plus 20% climate change – Water Level 9.60 (500mm Freeboard)
- 1 in 100 year plus 40% climate change - Water Level 9.95 (100mm Freeboard)

Comment G - It should be noted that the network model accounts for the 12.32 ha of catchment areas as defined in section 2.1.1 of the Surface Water Technical Note. The node contributing areas were added to confirm that all areas have been included in the analysis.

Noted.

Comment H - No general arrangements or details have been provided for any of the structures. It would be beneficial if cross section of the pond with geo-cellular crates including the location of inlets and outfalls and freeboard. The cross-sections should be provided on both axis and include an extent beyond the basin area to include adjacent ground levels. The details for other drainage measures should also be provided. We would recommend detail is provided to demonstrate how the above storage and below ground attenuation will operate.

Basin cross-sections are provided in drawing S102-PL-DR-700-P01, Typical Basins and Tank Sections, within report *CCE-S102-PL-RP-01-P06*.

Comment I - The requirements of Condition 17 also include information in relation to the ordinary watercourses adjacent to the site. We would recommend that information on the proposed changes to the watercourses is also submitted for this application.

The proposed changes are provided in the following drawings within report *CCE-S102-PL-RP-01-P06*:

S102-DA-DR-001-A02 Site Access Ditch Sections
S102-DA-DR-002-A02 Site Access Ditch Sections

Application No: CA/21/00486

Location: Grasmere Gardens, Land South Of The Ridgeway, Chestfield

Proposal: Details submitted pursuant to condition 17 (surface water drainage) of planning permission CA//17/00469/OUT

Thank you for your consultation on the above referenced planning application.

This planning application is supported by Surface Water Technical Note prepared by Cannon Consulting (February 2021). The report includes a drainage network model which assesses the operation of the drainage system under normal conditions and with a surcharged outfall in Swalecliffe Brook. A flood level of 9.14m has been used in the surcharged scenario.

Kent County Council as Lead Local Flood Authority have the following comments:

- a) The submission includes plan drawings, modelled drainage results and a drainage schematic. The node and link/pipe numbering are not fully consistent which leads to some difficulty in cross-referencing connectivity and network representation to confirm that the plan drawings represent the network model in the report. It would be recommended that the schematic be annotated with the plan drawing pipe numbers for easier cross-referencing. A portion of the schematic is also not visible (page 50).
- b) From initial assessment it appears that the operation of the system as shown within the modelled results is appropriate, though the drainage is modified from the originally submitted scheme but is consistent with the overall approach. However, as results are shown for the critical storm duration for each node, without the full network model it is difficult to understand the overall network operation. It would be beneficial if the network simulation solely for the 15-minute summer storm could be provided for the 1 in 30 year and 1 in 100 year plus 20% climate change events.
- c) The drainage system has been designed to criteria agreed with KCC Flood and Water Management team. The current modelled results show that a staged

discharge from the site controls surface water for the 1 in 2 year rainfall event to 11.5 l/s, for the 1 in 30 year to 30.1 l/s and for the 1 in 100 year plus 20% climate change to 45/1 l/s. These rates are within the 4 l/s/ha rate as required by Canterbury City Council but it also provides greater control for the more frequent rainfall events and manages potential impacts on Swalecliffe Brook.

- d) We would enquire as to the purpose for pipe 49.003 as it parallels the system in the highway (pipe no. 10.014, 10.015, 10.016, Surface Water Layout Sheet 2) and would appear to have relative invert levels which would enable discharge to 10.014. There is a lack of clarity as to the connectivity of Link 30.001 (Pipe 49.003) which connects to Node 202 and basin node 89. Node 202 has both an online and offline orifice control. We would recommend that detail of this connection is provided.
- e) The public have raised concerns in relation to the flood levels in the Swalecliffe Brook and the proposed developments impact on these levels and vice versa. The network model utilises a surcharged outfall water level of 9.14m which is very conservative, over the life time of the development. The modelled results demonstrate that the drainage system will retain the development generated surface water with limited overflow for the 1 in 100 year plus 40% climate change event. Given that the surcharge is maintained for the full modelled event, the likelihood of the overflow occurring is lower than presented.
- f) The designer has utilised orifice controls throughout the drainage system to retain water within the system and make use of its full volume. There are a number of orifices which are extremely small, less than 5 cm in diameter, which are usually located below geocellular systems but in some instances may be downstream of open attenuation (e.g. Node 16). It is usual that we would recommend a larger minimum diameter; however, in this instance if the orifices are below structures which will control debris and other material from blocking the orifice then the risk may be mitigated. We would recommend that the applicant reviews the locations of orifices less than or equal to 5 cm to ensure that blockage will not present a problem.
- g) It should be noted that the network model accounts for the 12.32 ha of catchment areas as defined in section 2.1.1 of the Surface Water Technical Note. The node contributing areas were added to confirm that all areas have been included in the analysis.
- h) No general arrangements or details have been provided for any of the structures. It would be beneficial if cross section of the pond with geocellular crates including the location of inlets and outfalls and freeboard. The cross-sections should be provided on both axis and include an extent beyond the basin area to include adjacent ground levels. The details for other drainage measures should also be provided. We would recommend detail is provided to demonstrate how the above storage and below ground attenuation will operate.

- i) The requirements of Condition 17 also include information in relation to the ordinary watercourses adjacent to the site. We would recommend that information on the proposed changes to the watercourses is also submitted for this application.

We would recommend that further information is provided to respond to the comments above before the condition is approved.

The comments above represent an initial review of the submission. Given the drainage scheme complexity and the information requested other matters may arise upon further review.

This response has been provided using the best knowledge and information submitted as part of the planning application at the time of responding and is reliant on the accuracy of that information.

Yours faithfully,

Bronwyn Buntine
Sustainable Drainage Team Leader
Flood and Water Management
