ASSESSMENT RESULTS

1. INTRODUCTION

- 1.1.1. This report presents the air quality assessment undertaken by WSP UK Ltd. This technical assessment addresses the potential changes in air quality impacts associated with the proposed development at University of Kent, Canterbury known as Sites BCD (herein referred to as the 'Site' or 'Proposed Development', with a specific focus on nearby ecological receptors. The objective is to support the promotion of the Site at Regulation 18 of Canterbury City Council (CCC)'s Local Plan by demonstrating the Site's suitability for development and its alignment with environmental protection standards.
- 1.1.2. Sensitive receptors include locations designated for the conservation of habitats and species with features that are sensitive to changes in air quality.
- 1.1.3. The air quality impacts are effects of concern from increased nitrogen oxides (NO_x) and ammonia (NH₃) concentrations in ambient air and nitrogen deposition rates (N-dep) due to vehicle emissions with the implementation of the Local Plan including the Site as a site allocation within the emerging Local Plan, and the effect on the integrity of ecological receptors.
- 1.1.4. Transport modelling was carried out for eight different scenarios in total. More detailed information on the site allocation scenarios modelled are provided in the WSP's Updated Regulation 18 Transport Appraisal Report (March 2025) and WSP's Disposal Sites - BCD - Highway Assessment (August 2025).
- 1.1.5. The transport modelling scenarios considered in the assessment presented in this report are as follows:
- 2019 baseline to represent recent conditions.
 - 2040 with the Local Plan (Scenario 2, herein referred to as the 'S2'), including forecast background growth and traffic associated with the Local Plan but without the Proposed Development.
 - 2040 with the Local Plan and Proposed Development (Scenario 8, herein referred to as the 'S8'), including forecast background growth, traffic associated the Local Plan and the Proposed Development.
- 1.1.6. The above scenarios have been specified to enable the impact of the Proposed Development 'alone' (between S8 and S2) to be apportioned when considering the changes due to the implementation of the Local Plan and the overall 'in-combination' change (between 2019 baseline and S8).
- 1.1.7. In this report, the consideration has been focussed on the impact to air quality at Habitats Sites, including Blean Complex Special Area of Conservation (SAC), Stodmarsh SAC, The Swale Special Protection Area (SPA)/Ramsar, Thanet Coast and Sandwich Bay SPA/Ramsar. Additionally, consideration has been made of the potential impact of the CCC local plan and other local plans for Ancient Woodlands (AW). **Figure 1** shows the location of Site and designated sites in relation to the CCC boundary and the surrounding local authorities.

2. SCOPE AND METHODOLOGY

2.1. SCOPE

- 2.1.1. There is potential for effects on nearby designated ecological sites during the operational phases of the Proposed Development. These effects may arise from changes in air quality due to traffic associated with future occupants/users and from the redistribution of traffic on the local road network resulting from the proposed Access Strategy and changes to the capacity.
- 2.1.2. Given the scale of the Proposed Development and findings from the previous air quality assessment undertaken by WSP for the Site (in 2022), it is anticipated that exceedances of the Joint Nature Conservation Committee's (JNCC)¹ Decision-Making Threshold and the Institute of Air Quality Management (IAQM)² screening threshold of annual average daily traffic (AADT) flow of 1,000 vehicle will occur on roads within 200m of designated ecological sites. To evaluate this, traffic data were screened, considering both the Proposed Development alone and in-combination with other plans and projects. This screening has determined the Zone of Influence (Zoi) for detailed dispersion modelling. The modelled road network within the Zoi is shown in **Figure 2**.

SENSITIVE DESIGNATED ECOLOGICAL SITES WITHIN THE ZOI

- 2.1.3. The following designated ecological sites fall within the Zoi:
- Thanet Coast & Sandwich Bay SPA (also designated RASMAR and SSSI);
 - The Swale SPA (also designated RASMAR and SSSI);
 - Stodmarsh SPA (also designated RASMAR);
 - Stodmarsh SAC (also designated SSSI);
 - Blean Wood SAC (also designated as);
 - Tankerton Slopes and Swalecliffe SAC;
 - West Blean and Thornden Woods SSSI;
 - Church Woods, Blean SSSI;
 - East Blean Woods SSSI;
 - Chequer's Woods and Old Park SSSI;
 - Larkey Valley Wood SSSI (also designated LNR);
 - Park Wood, Chilham SSSI;

- Tyler Hill Meadow LNR; and
- Ancient Woodlands.

2.2. METHODOLOGY

DISPERSION MODEL

- 2.2.1. Air quality dispersion modelling was carried out to determine the potential impacts on the identified ecological sites due to changes in NO_x and NH₃ concentrations and N-dep due to the operation of the Proposed Development. The modelling was undertaken using industry standard software (ADMS-Roads³) with reference to relevant assessment guidance including:
- The Department for Food and Rural Affairs (Defra) Local Air Quality Management Review and Assessment Technical Guidance⁴;
 - Natural England's approach to advising competent authorities on the assessment of road traffic emissions under the Habitats Regulations⁵; and
 - The IAQM's guidance on the Assessment of Air Quality Impacts on Designated Nature Conservation Sites².
- 2.2.2. The details of assessment methodology is presented in **Appendix B**.

MODELLLED TRANSECTS

- 2.2.3. The focus of this air quality assessment is the potential impact of road traffic emissions at the habitats sites. The pollutant concentrations have been predicted at receptor points arranged at 10m intervals in transects from the edge of the designated habitat site extending up to 200m from the centreline of the road. Pollutant contributions from these road sources have been combined with background pollutant data from the UK Centre for Ecology & Hydrology's Air Pollution Information System (APIS) website⁶ to give predictions of total annual mean NO_x and NH₃ concentrations and N-dep. Further details of background pollutants are given in **Appendix D**. Transect points were modelled at ground level.

⁵ Natural England (2018). Approach to advising competent authorities on the assessment of road traffic emissions under the Habitats Regulations (NEA001). <https://publications.naturalengland.org.uk/publication/4720542048845824>

⁶ UK Centre for Ecology & Hydrology (2025). Air Pollution Information System. <https://www.apis.ac.uk/>

2.2.4. The location of modelled transects are presented in **Figure 3**.

MODEL SCENARIOS

2.2.5. In order to determine the impacts of the Proposed Development both ‘alone’ and ‘in-combination’ with other Plans and Projects (as required by the Habitats Regulations⁷), the scenarios were modelled:

- 2019 – Baseline Year/Model Verification;
- Projected Baseline – 2019 Baseline traffic data with future emission factors (i.e. 2040) to provide an alternative future baseline;
- 2040 do-minimum (DM) – Future Baseline with the Local Plan and without the Proposed Development (S2); and
- 2040 do-something (DS) – Future Baseline with the Local Plan and with the Proposed Development (S8).

2.2.6. 2019 is the baseline year used for the CCC’s transport modelling. For consistency, this year has been used as the baseline year for this assessment. 2019 CCC’s monitoring data and 2019 meteorological data were used for the verification process. The year 2040 is the end of the emerging Local Plan period.

2.2.7. Therefore, to assess the impact of the Proposed Development ‘alone’, the S8 results have been compared with S2 results. Similarly, the S8 results have been compared with the Projected Baseline results to assess the impact of the Proposed Development ‘in-combination’ with the Local Plan.

METEOROLOGY

2.2.8. Detailed dispersion modelling requires hourly sequential meteorological data from a representative synoptic observing station. Hourly sequential meteorological data were obtained for the year 2019 for Manston Airport, which is considered to provide representative data for the area of interest.

TRAFFIC DATA

2.2.9. Traffic data used in the assessment were extracted from the Canterbury Strategic Traffic Model (STM) by Jacobs. The strategic modelling used the trip generation from the agreed Modelling Trip Generation Technical Note with trip distribution being directly from the STM. Details of traffic modelling and trip generations are presented in WSP’s Updated Regulation 18 Transport Appraisal Report (2025).

BACKGROUND POLLUTION DATA

2.2.10. Background NO_x data for the designated sites within the ZOI were obtained from Defra⁸, and background NH₃ and N-data were obtained from APIS⁶.

⁷ The Conservation of Habitats and Species Regulations 2017. Available at: <http://www.legislation.gov.uk/ukxi/2017/1012/contents/made>

⁸ Department for Environment, Food and Rural Affairs, (2025). <https://uk-air.defra.gov.uk/data/laqm-background-maps?year=2021>

2.2.11. For NH₃ and N-dep the JNCC's Nitrogen Futures⁹ 'business as usual' scenario has been assumed as the worst-case, which means that background NH₃ progressively increases due to expansion of intensive agriculture and, as a consequence, progressive reduction in background N-dep is diminished:

- The forecast background NH₃ for 2040 was determined assuming a year-on-year increase of 0.08% on average.
- The forecast background N-dep for 2040 was determined assuming a year-on-year reduction of 1.04% on average.

VEHICLE EMISSION FACTORS

2.2.12. Defra's vehicle emissions factors¹⁰ for NO_x are available to 2040. Emissions factors for NH₃ in 2040 have been taken from the Calculator for Road Emissions of Ammonia (CREAM)¹¹ toolkit, which is recognised but not endorsed by Defra (note: there is no endorsed method).

MODEL VERIFICATION

2.2.13. Model verification is a process by which modelled concentrations of air pollutants from road traffic emissions are adjusted based on actual measurement data. It enables an estimation of uncertainty and systematic errors associated with the dispersion modelling components of the air quality assessment to be considered. There are many explanations for these errors, which may stem from uncertainty in the modelled number of vehicles, speeds and vehicle fleet composition, as well as uncertainty associated with the emission factors. Defra has provided guidance in terms of preferred methods for undertaking dispersion model verification in LAQM.TG(22). Model verification involves the comparison of modelled concentrations and local monitoring data. Full details of the model verification procedure are provided in **Appendix B**. In summary, the verification process led to the use of a modelled road-NO_x adjustment factor of 1.626.

ASSESSMENT CRITERIA

- 2.2.14. For ecological receptors, it is usually the role of a suitably qualified ecologist, rather than an air quality specialist, to determine whether predicted impacts on air quality within a designated ecological site would result in a significant effect on the habitats present within the site. However, screening criteria can be used by the air quality specialists to identify when predicted impacts are unlikely to result in significant effects, thereby not requiring further assessment or specific mitigation.
- 2.2.15. To distinguish between negligible impacts and those that could potentially give rise to a significant effect, an established threshold of change in pollutant concentration or deposition rate of 1 percent (%) of the relevant Critical Level (CL_{VI}) or lower Critical Load (CL_d) was applied. Any change of 1% or less is considered negligible and highly unlikely to give rise to an adverse significant effect.

¹⁰ Department for Environment, Food and Rural Affairs, (2025). Emissions Factors Toolkit, version 13.1. <https://laqm.defra.gov.uk/air-quality/air-quality-assessment/emissions-factors-toolkit/>

¹¹ Air Quality Consultants, (2025). Calculator for Road Emissions of Ammonia CREAM V2A.

However, any change greater than 1% above the CLvl and/or CLd cannot be discounted as negligible and requires careful consideration by an experienced ecologist to determine the significance of the effect.

- 2.2.16. There are no statutory air quality standards for NH₃ and N-dep. Non-statutory CLvl for annual mean concentrations of NH₃ have been established by the United Nations Economic Commission for Europe (UNECE)¹² for all vegetation; these are:
 - 1µg/m³ for lower plants (lichen and bryophytes)
 - 3µg/m³ for higher plants (grasses, shrubs, trees etc)
- 2.2.17. For the air quality assessment, appropriate NH₃ CLvls and N-dep lower CLds have been assumed for ecological receptors.
- 2.2.18. The Blean Complex SAC site interest feature that is sensitive to changes in NO_x, NH₃ and N-dep is given by APIS as 'Sub-Atlantic and medio-European oak or oak-hornbeam forests of *Carpinion betuli* (H9160)'. The relevant lower CLd for N-dep is 15kg/ha/yr.
- 2.2.19. The Thanet Cost and Sandwich Bay SPA/RAMSAR/SSSI site interest features are not sensitive to changes in NO_x and NH₃. The interest features to change in N-dep is given by APIS as 'coastal dune grasslands (grey dunes)', 'low and medium altitude hay meadows' and 'Atlantic upper-mid & mid-low salt marshes'. The assumed lower CLd for N-dep is 10kg/ha/yr.
- 2.2.20. The Swale SPA/RAMSAR/SSSI site interest features are not sensitive to changes in NO_x and NH₃. The interest features to change in N-dep is given by APIS as 'low and medium altitude hay meadows' and 'Atlantic upper-mid & mid-low salt marshes'. The assumed lower CLd for N-dep is 10kg/ha/yr.
- 2.2.21. The West Blean and Thornden Woods SSSI site interest feature that is sensitive to changes in NO_x, NH₃ and N-dep is given by APIS as 'Acidophilous Quercus-dominated woodland'. The relevant lower CLd for N-dep is 10kg/ha/yr.
- 2.2.22. For LNR, the main habitat is neutral grassland. The assumed lower CLd for N-dep is 10kg/ha/year.
- 2.2.23. The CLd for woodland habitats in the UK has been defined to be within a wide range of 5 to 20 kg/ha/yr, depending on woodland vegetation types. There are more specific CLd ranges where information is available to assign vegetation types (e.g. acidic oak-birch woods, beech or native pine woods). Where information is unavailable to determine woodland vegetation types, a lower CLd of 10kg/ha/yr has been assumed.
- 2.2.24. Details of site relevant CLvl and CLd values for ecological receptors are listed in **Appendix C**.

¹² UN ECE Convention on Long-range Transboundary Air Pollution, (2007). Report on the Workshop on Atmospheric Ammonia: Detecting Emission Changes and Environmental Impacts. Available online at: http://www.ammonia-ws.ceh.ac.uk/documents/ece_eb_air_wg_5_2007_3_e.pdf

2.3. LIMITATIONS & ASSUMPTIONS

- 2.3.1. There are uncertainties associated with both measured and predicted concentrations. The model (ADMS-Roads) used in this assessment relies on input data (including predicted traffic flows), which also have uncertainties associated with them. The model itself simplifies complex physical systems into a range of algorithms. In addition, local micro-climatic conditions may affect the concentrations of pollutants that the ADMS-Roads model will not take into account.
- 2.3.2. In order to reduce the uncertainty associated with predicted concentrations, model verification has been carried out following guidance set out in LAQM.TG(22). As the model has been verified against local monitoring data and adjusted accordingly, there can be reasonable confidence in the predicted concentrations.
- 2.3.3. The method for the projection of traffic datasets to future years has been result of consultation with CCC as described in Transport Assessment report. Such projections are representations of reality based on the best available scientific consensus at the time and the assumptions of what traffic generating development will be consented in the future. Such projections are influenced by market forces, technical advances, planning decisions and funding availability that may not be accounted for within the projections.
- 2.3.4. The network alignment has been developed based on traffic data shapefiles, as supplied by Jacobs.

3. OVERVIEW OF BASELINE CONDITIONS

3.1. LOCAL AIR QUALITY

- 3.1.1. The Site is located in an area where local air quality is mainly influenced by emissions from road transport using A290 to the west and Wood Hill/Canterbury Hill to the east. There are a few roads, such as Parkwood Road, Giles Lane and University Road, that run through the campus area and the following areas of AW: Park Wood and Brethren Wood. However, these roads most likely experience low volumes of traffic. Similarly, in most instances, the identified designated ecological sites are located away from major roads (with the exception of Blean Complex SAC and Church Woods, Blean SSSI).
- 3.1.2. Currently, CCC has two Air Quality Management Areas (AQMA) within its administrative area. The Canterbury City Centre AQMA is located within 1.9km of the Site. This AQMA was declared for exceedances of the annual mean objective for NO₂ (40µg/m³). There are no Habitat sites within this AQMA.
- 3.1.3. CCC updated its Air Quality Action Plan (AQAP) in 2025 to outlines the actions to improve and further maintain air quality in Canterbury and Herne between 2024 - 2029. Whilst the AQMA designation and production of the AQAP are targeted towards the protection of human health, in line with CCC's LAQM responsibilities, a number of the measures outlined within the AQAP will benefit air quality in the general area, including within Zol.
- 3.1.4. CCC operates a network of 33 passive diffusion tubes in the district and two automatic monitoring stations during 2023. Most of the diffusion tubes are located in and around the City Centre AQMA (i.e. away from the Site and the identified ecological sites).
- 3.1.5. CCC's most recent Annual Status Report, published in 2024, indicates that current air quality within Canterbury is good with no exceedances of the air quality objective for annual mean NO₂ concentrations were recorded at all monitoring sites.

3.2. BACKGROUND CONCENTRATIONS AND DEPOSITION RATES

- 3.2.1. The background annual mean concentrations of NO_x for years 2019 and 2040 from Defra for the grid squares containing the identified designated ecological sites were summarised and presented in **Appendix D**. In both 2019 and 2040 assessment years, the CLvl of 30µg/m³ was predicted to be met in all the identified grid squares.
- 3.2.2. Background rates of N-dep were obtained from the APIS website, where deposition rates have been mapped for the whole of the UK at a grid resolution of 1 x 1 km grid squares for a three-year averaging period (2018 - 2020). The data are included in **Appendix D**. The information from APIS indicates that the lower CLd values are exceeded at all of the identified designated ecological sites.
- 3.2.3. The information from APIS indicates that the applicable CLvl for NH₃, 3µg/m³, based on the habitat for higher plants, is met at all of the of the identified designated ecological sites.

4. ASSESSMENT RESULTS

- 4.1.1. Detailed results for all transect receptors and modelled scenarios are given in **Appendix E**. The tables below give the key findings from examination of these detailed results, with **Table 4-1** for impacts on annual mean NO_x concentrations, **Table 4-2** and **Table 4-3** for impacts on annual mean NH₃ concentrations, and **Table 4-4** for impacts on N-dep. The tables provide the following information:
- If the relevant CLvl or CLd is exceeded in a particular scenario;
 - The greatest change in concentration or N-dep rate with the Proposed Development alone;
 - The greatest percentage change in concentration or N-dep rate relative to the relevant CLvl or CLd with the Proposed Development alone;
 - If the maximum concentration or N-dep rate exceeds the relevant CLvl or CLd and the percentage change exceeds the 1% screening threshold with the Proposed Development alone;
 - The greatest change in concentration or N-dep rate with the Proposed Development in-combination with other projects and plans;
 - The greatest percentage change in concentration or N-dep rate relative to the relevant CLvl or CLd with the Proposed Development in-combination with other projects and plans;
 - If the maximum concentration or N-dep rate exceeds the relevant CLvl or CLd and the percentage change exceeds the 1% screening threshold with the Proposed Development in-combination with other projects and plans; and
 - Potential risk of exceedance of relevant CLvl or CLd and 1% screening threshold in-combination in Local Plan HRA.
- 4.1.2. There are no predicted exceedances of CLvl for NO_x of 30µg/m³ in 2040 at all (**Table 4-1**). Consequently, all impacts on NO_x concentrations with the Proposed Development – both alone and in-combination – are considered to be negligible.
- 4.1.3. For annual mean NH₃, there are no predicted exceedances of the CLvl of 3µg/m³ for higher plants. In this regard all impacts of the Proposed Development – both alone and in-combination – are considered to be negligible.
- 4.1.4. There are predicted exceedances of CLvl of 1µg/m³ for lower plants (bryophytes and lichen) which may not be considered to be negligible at sites that would be subject to Local Plan HRA, including The Swale SPA, Stodmarsh SPA, Stodmarsh SAC and Blean Complex SAC. However, such features are only noted by APIS Stodmarsh SAC and Blean Complex SAC
- 4.1.5. Predicted N-dep rates exceed the relevant CLd at all locations under all modelling scenarios, both for the proposed Development alone and in-combination. At The Swale SPA/Ramsar/SSSI, Stodmarsh SPA/Ramsar, Blean Complex SAC and Stodmarsh SSSI/SAC, change in N-dep exceed 1% of the lower CLd, indicating a potential risk of exceedance both alone and in-combination.
- 4.1.6. Although changes in N-dep exceeds 1% of the relevant CLd at some locations, overall N-dep are projected to decline between the 2019 baseline and 2040 due to improvements in vehicle emissions and background deposition rates.

Table 4-1 – Key Findings for Impacts on Annual Mean NOx Concentrations

Site within Zol	Covered by Habitats Regulations?	CLvl (µg/m³)	Exceedance of CLvl for NOx (µg/m³)?				Max. Change in NOx with Proposed Development alone	% change alone relative to CLvl	DS exceedance of CLvl and Proposed Development alone change >+1% of CLvl	Max. 5. CONCLUSIONS

- Predicted concentrations of NO_x are below the CL_{VI} of 30µg/m³ in all scenarios including with the implementation of the Local Plan and the Proposed Development. As concentrations do not exceed the CL_{VI}, no adverse effects are predicted at any of the designated ecological sites within the study area (including Habitats sites that are subject to HRA), irrespective of the change in concentrations predicted due to the development of the Site either 'alone' or 'in-combination' with other plans and projects.
- Predicted concentrations of NH₃ are also below the CL_{VI} of 3µg/m³ (within an uncertainty range of 2 – 4 µg/m³) which is typically applicable to all habitats, except those where lichens and bryophytes may be present (where a CL_{VI} of 1µg/m³ applies). It should be noted that background concentrations of NH₃ alone exceed 1µg/m³ (i.e. the exceedances are not caused by either the Local Plan or Proposed Development).
- The only Habitat sites where exceedances of 1% of the CL_{VI} (of 1µg/m³) occur, either 'alone' due to the development of the Site or 'in-combination' with other plans and projects, and where there is sensitivity to NH₃ concentrations and a CL_{VI} of 1µg/m³ could apply, are Stodmarsh SAC and Blean Complex SAC. Further work would be undertaken at planning application stage to determine the presence (or otherwise) of lichens and bryophytes within these SACs, in locations affected by forecast changes in traffic.
- For N-dep, the results indicate potential for exceedances of 1% of the relevant CL_d due to the Proposed Development 'alone' at the following Habitats sites: The Swale SPA and Stodmarsh SAC. Two additional sites are screened in (Stodmarsh SPA and Blean Complex SAC) when considering exceedances of the 1% criterion 'in-combination'. Exceedances of 1% are also predicted at a number of the SSSI's, LNRs and AW units where they fall within 200m of the affected road network. In all cases, predicted rates of N-dep are lower in the future scenarios, including with the implementation of the Local Plan and Proposed Development, than they are in the 2019 baseline case. This is due to forecast future reductions in background rates of N-dep and emissions of NO_x. The Proposed Development therefore results in a retardation of future improvements in rates of N-dep rather than a worsening of total N-dep rates, when compared to the current (2019) baseline.
- These results do not take into account mitigation for the development of the Site or strategic mitigation that may be required following the completion of the Local Plan HRA (that may result in more widespread improvements in traffic/emissions). At planning application stage the impacts of Proposed Development would be considered and where appropriate a package of mitigation measures developed.

Appendix A

GLOSSARY

Term	Definition
AADT Annual Average Daily Traffic	A daily total traffic flow (24 hrs), expressed as a mean daily flow across all 365 days of the year.
Adjustment	Application of a correction factor to modelled results to account for uncertainties in the model
Accuracy	A measure of how well a set of data fits the true value.
Air quality objective	Policy target generally expressed as a maximum ambient concentration to be achieved, either without exception or with a permitted number of exceedances within a specific timescale (see also air quality standard).
Air quality standard	The concentrations of pollutants in the atmosphere which can broadly be taken to achieve a certain level of environmental quality. The standards are based on the assessment of the effects of each pollutant on human health including the effects on sensitive sub groups (see also air quality objective).
Ambient air	Outdoor air in the troposphere, excluding workplace air.
Annual mean	The average (mean) of the concentrations measured for each pollutant for one year.
AQMA	Air Quality Management Area.
Conservative	Tending to over-predict the impact rather than under-predict.
CLd	Critical load. This is “a quantitative estimate of exposure to one or more pollutants below which significant harmful effects on specified sensitive elements of the environment do not occur according to present knowledge” (source: http://www.apis.ac.uk/critical-loads-and-critical-levels-guide-data-provided-apis#_Toc279788050)
Critical Level (CLvl)	Critical level. Critical levels are defined as “concentrations of pollutants in the atmosphere above which direct adverse effects on receptors, such as human beings, plants, ecosystems or materials, may occur according to present knowledge” (source: http://www.apis.ac.uk/critical-loads-and-critical-levels-guide-data-provided-apis#_Toc279788050)
CREAM	Calculator for Road Emissions of Ammonia
Data capture	The percentage of all the possible measurements for a given period that were validly measured.
Defra	Department for Environment, Food and Rural Affairs.
Dust	Dust comprises particles typically in the size range 1-75 micrometres (µm) in aerodynamic diameter and is created through the action of crushing and abrasive forces on materials
Emission rate	The quantity of a pollutant released from a source over a given period of time.

Term	Definition
Exceedance	A period of time where the concentration of a pollutant is greater than the appropriate air quality standard.
Fugitive emissions	Emissions arising from the passage of vehicles that do not arise from the exhaust system.
HDV/HGV	Heavy Duty Vehicle/Heavy Goods Vehicle.
LAQM	Local Air Quality Management.
Model adjustment	Following model verification, the process by which modelled results are amended. This corrects for systematic error.
N-dep	Nitrogen deposition rate in kilograms per hectare per year
NH ₃	Ammonia
NO ₂	Nitrogen dioxide.
NO _x	Nitrogen oxides.
Road link	A length of road which is considered to have the same flow of traffic along it. Usually, a link is the road from one junction to the next.
SAC	Special Area of Conservation
µg/m ³	Micrograms per cubic metre. A measure of concentration in terms of mass per unit volume. A concentration of 1µg/m ³ means that one cubic metre of air contains one microgram (millionth of a gram) of pollutant.
Uncertainty	A measure, associated with the result of a measurement, which characterizes the range of values within which the true value is expected to lie. Uncertainty is usually expressed as the range within which the true value is expected to lie with a 95% probability, where standard statistical and other procedures have been used to evaluate this figure. Uncertainty is more clearly defined than the closely related parameter 'accuracy', and has replaced it on recent European legislation.
Validation (modelling)	Refers to the general comparison of modelled results against monitoring data carried out by model developers.
Verification (modelling)	Comparison of modelled results versus any local monitoring data at relevant locations.

Appendix B

DETAILS OF METHODOLOGY

MODEL INPUTS AND PARAMETER

Table 5-1 summarised the input and parameters applied in the assessment.

Table 5-1 - Model inputs and parameters

Item	Details
Model	The dispersion model (ADMS-Roads version 5.0.0.1) ¹³
Scenarios	The traffic data underpinning this assessment was produced by Jacobs's Transportation Modelling Team on behalf of Canterbury City Council. Data from the strategic model has been provided for the following scenarios: 2019 Baseline – for model verification - Projected Base 2040 Scenario 2 2040 Scenario 8 The S2 scenario includes background growth and with other project and plans of the Local Plan but without Proposed Development. The S8 scenario includes background growth and with other project and plans of the Local Plan but with Proposed Development.
Background Contribution	Background NO_x concentrations used in the assessment have been taken from the Defra website¹⁴. The map provides estimates at a 1 x 1 km grid resolution for the whole of the UK. Estimated concentrations for NO₂, oxides of nitrogen (NO_x) (which is required in the calculation of NO₂ concentrations). The latest version with a 2021 Reference Year for all years between 2021 and 2050. Inherent within the background maps is the assumption that background concentrations will improve (i.e. reduce) over time. For baseline year 2019, previous version of background map is used, which is based on a 2018-Reference Year.
Vehicle Emission Factors	For 2040 scenario, NO_x emission data were obtained from the Defra's Emissions Factors Toolkit (EFT) (Version 13.1) (published in March 2025) available on Defra's website¹⁵. This toolkit allows for the calculation of emission factors arising from road traffic for all years between 2021 and 2050. For the prediction of future year

¹³ Cambridge Environmental Research Consultants (2024) ADMS-Roads. [Online] accessed via: <https://www.cerc.co.uk/environmental-software/ADMS-Roads-model.html> (Accessed: March 2025).

¹⁴ Department for Environment, Food and Rural Affairs (2024) UK AIR - Air Information Resource website. [Online] accessed via: <https://uk-air.defra.gov.uk/data/laqm-background-home> (Accessed: September 2025).

¹⁵ Defra (2025) Emissions Factors Toolkit. [Online] accessed via: <https://laqm.defra.gov.uk/air-quality/air-quality-assessment/emissions-factors-toolkit/> (Accessed: September 2025).

Item	Details
	emissions, the toolkit takes into account factors such as anticipated advances in vehicle technology and changes in vehicle fleet composition. For 2019 baseline, NO_x emission data were obtained from the Defra's EFT (Version 12.1). This toolkit allows for the calculation of emission factors arising from road traffic for all years between 2018 and 2040. The EFT accounted for traffic flow characteristics for the local road network in all assessment years, including: ▪ Road type (e.g., urban, rural, motorway); ▪ AADT flow by link; ▪ Average daily vehicle speeds (kph); and ▪ Percentage of heavy-duty vehicles (HDV) per link. EFT Setting: ▪ Area = England (not London) ▪ Traffic format = Basic Split ▪ Road Type = Rural (not London) and Urban (not London) ▪ Output = Air Quality Modelling (g/km/s) The emissions database outputs for each respective scenario provided road link-specific pollutant emission rates (g/km/s), which were input into the ADMS-Roads dispersion model to enable prediction of road-NO_x, at identified sensitive receptor locations. Traffic data and emission factors are available upon request, given the extensive size of the dataset.
Road source geometry	All model links aligned to the carriageway centreline, set to true road width (kerb to kerb/edge of travelled lanes). Road heights set to zero.
Meteorological data	Manston Airport meteorological station 2019 Parameters include hourly sequential format: Julian date, hour, wind speed (m/s), wind direction (degrees from north), cloud cover (oktas), surface temperature (Celsius). Meteorological site roughness length = 0.2m Meteorological site minimum Monin-Obukhov length = 10m Dispersion site latitude = 51.35° Dispersion site roughness length = 0.5m Dispersion site minimum Monin-Obukhov length = 10m

Item	Details						
Results Processing	The ADMS-Roads dispersion model has been validated for this type of assessment and is considered to be fit for purpose. Model validation undertaken by the software developer will not, however, have included validation in the vicinity of the Site.						
	To determine the performance of the model at a local level, a comparison of modelled results with local monitoring data at relevant locations was undertaken. This process of verification aims to minimise modelling uncertainty and systematic error by correcting modelled results by an adjustment factor to gain greater confidence in the final results. The verification process was carried out following the methodology specified in LAQM.TG(22).						
	The details of CCC’s NO₂ monitoring sites used for the purpose of model verification are provided in the next section.						
	Model verification was undertaken following the methodology specified in Chapter 7 of LAQM.TG(22) using the NO_x to NO₂ calculator (Version 9.1) available from the Defra website¹⁶. This calculated the roadside NO_x component of the annual mean NO₂ concentrations measured at the monitoring sites.						
	A factor of 1.626 was obtained during the verification process which indicated that the model was under-predicting. This factor was applied to the modelled road-NO_x outputs prior to conversion to annual mean NO₂ concentrations using the NO_x to NO₂ calculator (version 9.1) provided by Defra¹⁶.						
	NO_x and Ammonia Concentrations						
	The ADMS-Roads model was used to predict the road-NO_x and road-NH₃ concentration at each receptor for all of the assessment scenarios. Following application of the verification factor, the adjusted modelled road-NO_x and road-NH₃ concentrations were then added to the background NO_x and NH₃ concentrations to calculate the total annual mean NO_x and NH₃ concentrations for comparison against their relevant Critical Levels.						
N-dep							
Convert NO₂ and NH₃ to dry N-dep							
The modelled road pollutant concentrations were converted to dry deposition flue rate (µg/m²/s) by applying conversion factors as provided the table below.							
	<table><tr><th>Chemical species</th><th colspan="2">Deposition velocity (m/s)</th></tr><tr><td>NO₂</td><td>Grassland (low vegetation)</td><td>0.0015</td></tr></table>	Chemical species	Deposition velocity (m/s)		NO ₂	Grassland (low vegetation)	0.0015
Chemical species	Deposition velocity (m/s)						
NO ₂	Grassland (low vegetation)	0.0015					

¹⁶ Defra (2024) NO_x to NO₂ Calculator. [Online] accessed via: <https://laqm.defra.gov.uk/air-quality/air-quality-assessment/nox-to-no2-calculator/> (Accessed: March 2025).

Item	Details		
		Forest (tall vegetation)	0.003
	NH ₃	Grassland (low vegetation)	0.02
		Forest (tall vegetation)	0.03
	For NO ₂ , the modelled road-NOx concentrations were converted to road-NO ₂ concentrations using Defra’s NOx to NO ₂ calculator before applying the conversion factors.		
Calculate N-dep for dry deposition flux of NO₂ and NH₃:			
To convert the dry deposition flux from units of µg/m ² /s to units of kg/ha/year multiply the dry deposition flux by the conversion factors shown in the table below.			
Chemical species		Conversion factor to kg/ha/year	
NO ₂		95.9	
NH ₃		259.7	
The modelled road-contributed pollutant concentrations were added to the relevant background N-dep rate to give the total deposition rate at each ecological receptor:			
Total N-dep rate (kg/ha/yr) = (NO ₂ dry deposition flux x 95.9 + NH ₃ dry deposition flux x 259.7) + background N-dep.			
The total N-dep rates were then compared to the lowest value of the site-specific Critical Load range applicable to the habitat present in the ecological sites.			

VERIFICATION

MODEL VERIFICATION

The comparison of modelled concentrations with local monitored concentrations is a process termed 'verification'. Model verification investigates the discrepancies between modelled and measured concentrations, which can arise due to the presence of inaccuracies and/or uncertainties in model input data, modelling and monitoring data assumptions. The following are examples of potential causes of such discrepancy:

- a) Estimates of background pollutant concentrations;
- b) Meteorological data uncertainties;

- c) Traffic data uncertainties;
- d) Model input parameters, such as 'roughness length'; and
- e) Overall limitations of the dispersion model.

NITROGEN DIOXIDE

Most nitrogen dioxide is produced in the atmosphere by the reaction of nitric oxide (NO) with ozone. It is therefore most appropriate to verify the model in terms of the primary pollutant emissions of nitrogen oxides ($\text{NO}_x = \text{NO} + \text{NO}_2$), in line with the guidance provided within LAQM.TG(22).

The model has been run to predict the 2019 annual mean road- NO_x contribution at five roadside diffusion tubes within the modelled road network. The model outputs of road- NO_x have been compared with the 'measured' road- NO_x , which was determined from the NO_2 concentrations measured using diffusion tubes at the monitoring locations, utilising the NO_x from NO_2 calculator provided by Defra and the NO_2 background concentration (from the Defra background map). As discussed in the methodology section, the most recent suitable data available for model verification purposes is 2019 data.

A number of diffusion tubes were not considered suitable for the purpose of model verification as they were not reflective of the likely conditions (and therefore performance) of the model within the vicinity of the designated ecological sites.

The table below (E1) presents the monitoring data excluded in the verification along with justification/the rationale for this decision.

Table E1 - Data excluded in model verification

Monitoring Site	2019 Measured Annual Mean NO_2 Concentration ($\mu\text{g}/\text{m}^3$)	Justification
CM1	12.3	Background site
DT3	32.6	Street canyon
DT12	38.3	Tube position close to the sign
DT13	11.9	Background site
DT14	39.8	Street canyon
DT15	42.5	Street canyon
DT17	38.6	Adjacent to bus lane
DT18	33.1	Kerbside site
DT19	38.8	Tube position close to junction/crossing and queue condition
DT20	30.6	Street canyon

Monitoring Site	2019 Measured Annual Mean NO ₂ Concentration (µg/m ³)	Justification
DT23	44.1	Kerbside site
DT35	31.9	Tube position close to crossing
DT44	35.2	Kerbside site
DT53	35.3	Gradient
DT57	30.1	Kerbside site
DT60	34.6	Bus station exposure
DT67	-	No data
DT68	-	No data
DT70	-	No data
DT75	-	No data
DT779	-	No data
CA98	-	No data
DT7	25.2	Street canyon and parked car
DT10	25.8	Tube position close to the sign
DT21	25.7	Street canyon
DT32	28.1	Kerbside site
DT34	30.7	Façade location and tube position closes to bus stop
DT36	27.6	Kerbside site
DT58	22.8	Kerbside site

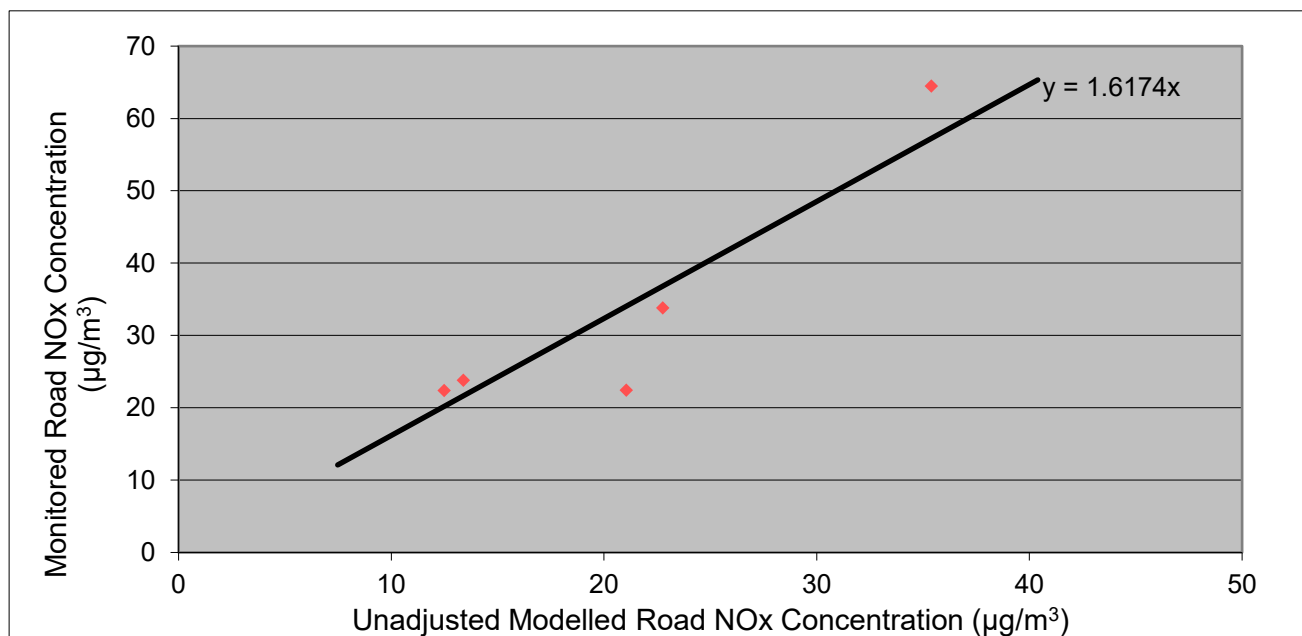

Table E2 presents the monitoring locations utilised within model verification.

Table E2 - Data used in model verification

Monitoring Site	Measured Annual Mean NO ₂ Concentration (µg/m ³)	Background NO ₂ (µg/m ³)	Measured Road-NO _x (µg/m ³) (from NO _x :NO ₂ calculator)	Modelled Road-NO _x (µg/m ³)	Ratio
CM3	25.3	13.6	22.4	12.5	-44.3
DT4	44.6	13.8	64.5	35.4	-45.1
DT16	26	13.6	23.8	13.4	-43.8
DT5	29.6	12.3	33.8	22.8	-32.7
DT37	23.1	11.3	22.5	21.1	-6.3

The road-NO_x adjustment factor was determined as the slope of the best fit line between the 'measured' road contribution and the model derived road contribution, forced through zero (Plate 1-1). This factor was then applied to the modelled road-NO_x concentration for each monitoring site to provide adjusted modelled road-NO_x concentrations. The total nitrogen dioxide concentrations were then determined by inputting the adjusted modelled road-NO_x concentrations and the background NO₂ concentration into the NO_x to NO₂ calculator.

Plate 5-1 - Comparison of Monitored Road-NO_x with Unadjusted Modelled Road-NO_x

MODEL UNCERTAINTY

An evaluation of model performance has been undertaken to establish confidence in model results. LAQM.TG(22) identifies a number of statistical procedures that are appropriate to evaluate model performance and assess the uncertainty. These include:

- a) Root mean square error (RMSE);
- b) Fractional bias (FB); and
- c) Correlation coefficient (CC).

These parameters estimate how the model results agree or diverge from the observations. These calculations can be carried out prior to, and after adjustment, or based on different options for adjustment, and can provide useful information on model improvement. A brief explanation of each statistic is provided in Table 1-2, and further details can be found in Box 7.17 of LAQM.TG(22).

Table 5-2 - Methods for describing model uncertainty

Statistical Parameter	Comments	Ideal value
Root Mean Square Error	RMSE is used to define the average error or uncertainty of the model. The units of RMSE are the same as the quantities compared. If the RMSE values are higher than 25% of the objective being assessed, it is recommended that the model inputs and verification should be revisited in order to make improvements. For example, if the model predictions are for the annual mean NO₂ objective of 40 µg/m³, if an RMSE of 10µg/m³ or above is determined for a model it is advised to revisit the model parameters and model verification. Ideally an RMSE within 10% of the air quality objective would be derived, which equates to 4µg/m³ for the annual mean NO₂ objective.	0.01
Fractional Bias	It is used to identify if the model shows a systematic tendency to over or under predict. FB values vary between +2 and -2 and has an ideal value of zero. Negative values suggest a model over-prediction and positive values suggest a model under-prediction.	0.00
Correlation Coefficient	It is used to measure the linear relationship between predicted and observed data. A value of zero means no relationship and a value of 1 means absolute relationship. This statistic can be particularly useful when comparing a large number of model and observed data points.	1.00

To assess the uncertainty of a model, the RMSE is the simplest parameter to calculate providing an estimate of the average error of the model in the same units as the modelled predictions. It is also

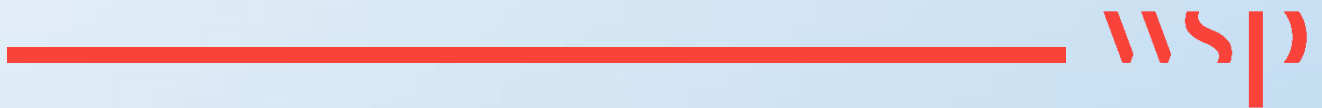

often easier to interpret the RMSE than the other statistical parameters and therefore it has been calculated in this assessment to understand the model uncertainty.

The RMSE value calculated after verification was $3.0\mu\text{g}/\text{m}^3$, which is well within 10% of the objective, and therefore the final predictions are considered to be robust.

Appendix C

DESIGNATED SITES CRITICAL LOADS AND CRITICAL LEVELS

Details of site relevant critical levels and critical loads for ecological receptors are listed in Table 5.

Table 3 – Critical Levels and Critical Loads for Ecological Receptors

Name	Habitat	NO _x Critical Level	NH ₃ Critical Level	N-dep Lower Critical (kg/ha/yr)
Thanet Coast & Sandwich Bay SPA (also designated RASMAR and SSSI)	TBC	30	Not sensitive	10 (Atlantic upper-mid & mid-low salt marshes)
The Swale SPA (also designated RASMAR and SSSI)	TBC	30	Not sensitive	10 (Atlantic upper-mid & mid-low salt marshes)
Stodmarsh SPA (also designated SAC, RASMAR and SSSI)	TBC	30	Not sensitive	10 (Atlantic upper-mid & mid-low salt marshes)
Blean Wood SAC (also designated as Church Woods SSSI)	Broad-leaved, Mixed and yew woodland	30	3 (Higher plans including heathland, grassland and forest ground flora)	15 (Meso- and eutrophic Quercus woodland)
Tankerton Slopes and Swalecliffe SAC	TBC	30	3	Decision to be taken at a site-specific level since habitat sensitivity depends on N or P limitation.
West Blean And Thornden Woods SSSI	Broad-leaved, Mixed and yew woodland	30	3 (Higher plans including heathland, grassland and forest ground flora)	10 (Woodland)
East Blean Woods SSSI	TBC	30	1 or 3	10 (Acidophilous Quercus forest)

Name	Habitat	NOx Critical Level	NH ₃ Critical Level	N-dep Lower Critical (kg/ha/yr)
Chequer's Woods and Old Park SSSI		30	1 1 or 3	10 (Broadleaved deciduous woodland)
Larkey Valley Wood SSSI (also designated LNR)	Mercurialis Perennis Woodland	30	1 or 3	10 (Fagus forest on non-acid and acid soils) 15 (Carpinus and Quercus mesic deciduous forest)
Park Wood, Chilham SSSI	Mercurialis Perennis Woodland	30	1 or 3	15 (Carpinus and Quercus mesic deciduous forest)
Ellenden Wood SSSI	Deschampsia Flexuosa Woodland	30	1 or 3	10 (Acidophilous Quercus forest)
Bus Compancy Island LNR	TBC	30	1 or 3	10 (Broadleaved deciduous woodland)
Foxes Cross Bottom LNR	TBC	30	1 or 3	10 (Broadleaved deciduous woodland)
Whitehall Meadows LNR,	TBC	30	1 or 3	10 (Broadleaved deciduous woodland)
Tyler Hill Meadow LNR	Broad-leaved, Mixed and yew woodland	30	3 (Higher plans including heathland, grassland and forest ground flora)	20-30 (neutral grassland)
Ancient Woodlands.	Broad-leaved, Mixed and yew woodland	30	3 (Higher plans including heathland, grassland and forest ground flora)	10 (Woodland)
